# MATH 23500: Calculus II Lecture Notes Created by Dr. Amanda Harsy <br> (C)Harsy 2022 

October 2, 2023
© Harsy 2023

## Contents

1 Syllabus and Schedule ..... viii
2 Syllabus Crib Notes ..... ix
2.1 Office Hours ..... ix
2.2 Grades ..... ix
2.2.1 Exams ..... ix
2.3 Expectations ..... ix
3 Review Calculus I ..... 1
4 Hyperbolic Functions ..... 5
4.1 Introduction of Hyperbolic Functions ..... 5
4.2 Derivatives of Hyperbolic Functions and their Inverses ..... 7
4.3 Antiderivatives of Hyperbolic Functions and their Inverses ..... 8
4.4 ICE - Hyperbolic Functions ..... 9
5 Average Value ..... 11
5.1 Net Change ..... 11
5.2 Average Value of a Function ..... 13
5.3 Mean Value Theorem for Integrals ..... 14
5.4 ICE- Average Value ..... 17
6 Integration By Parts ..... 21
6.1 Strategy for Integration By Parts ..... 22
6.2 Cycling Integrals ..... 23
6.3 ICE - Integration By Parts ..... 25
7 Integration Techniques for Higher Trig Functions ..... 27
7.1 Trig Identities ..... 27
7.2 Strategy for Integrating Powers of Sine and Cosine ..... 27
7.3 Strategy for Integrating Powers of Tangent and Secant ..... 29
7.4 Strategy for Integrating Powers of Cotangent and Cosecant ..... 30
7.5 Using Addition Trigonometric Properties ..... 30
7.6 ICE - Higher Trig Techniques for Integration ..... 31
8 Inverse Trigonometric Substitution Techniques for Integration ..... 33
8.1 Strategy for Inverse Trigonometric Substitution ..... 34
8.2 ICE - Inverse Trig Substitution ..... 39
9 Integration Using Partial Fractions ..... 41
9.1 Partial Fractions ..... 41
9.2 Partial Fractions Procedure: ..... 42
9.3 ICE - Partial Fractions ..... 47
10 Approximating Integrals Using Numerical Methods ..... 49
10.1 Approximating Integrals Review ..... 49
10.2 Midpoint Rule ..... 50
10.3 The Trapezoid Rule ..... 51
10.4 Simpson's Rule ..... 52
10.5 Approximating Error in Numerical Methods ..... 53
10.6 ICE - Numerical Approximation ..... 55
11 Strategy for Integration ..... 57
11.1 Interesting Examples ..... 59
11.2 ICE - Review of Integral Techniques ..... 61
12 Volumes of Rotations ..... 63
12.1 Disk Method ..... 63
12.2 Washer Method ..... 64
12.3 Cylindrical Shells Method ..... 67
12.4 ICE - Volumes ..... 73
13 Arc Length ..... 77
13.1 ICE - Arc Length ..... 79
14 Surface Area ..... 81
14.1 Deriving Surface Area of a Revolution ..... 81
14.2 Surface Area of a Revolution about x-axis ..... 81
14.3 Surface Area of a Revolution about y-axis ..... 83
14.4 ICE - Surface Area ..... 85
15 Using Integrals to Calculate Work and Hydrostatic Force ..... 87
15.1 Work with constant Force ..... 87
15.2 Work with varying Force ..... 88
15.3 Hydrostatic Force ..... 91
15.4 ICE - Work and Hydrostatic Force ..... 93
16 Improper Integrals ..... 95
16.1 Calculating Improper Integrals ..... 95
16.2 Comparison Tests for Improper Integrals ..... 97
16.3 ICE - Improper Integrals ..... 101
17 Review ..... 103
17.1 ICE -Gabriel's Horn ..... 103
18 Sequences ..... 105
18.1 Introduction to Sequences ..... 105
18.2 Limits of Sequences ..... 106
18.3 Properties and Theorems for Sequences ..... 107
18.4 ICE - Sequences ..... 111
19 Series ..... 113
19.1 Sequence of Partial Sums ..... 113
19.2 Geometric Series ..... 114
19.3 Telescoping Series ..... 116
19.4 Properties of Series ..... 117
19.5 ICE - Series ..... 119
20 Tests for Convergence for Series ..... 121
20.1 The Test for Divergence ..... 121
20.2 Integral Test ..... 122
20.3 The P-Test ..... 124
20.3.1 Estimating Sums of Series using Improper Integrals ..... 125
20.3.2 ICE - Integral and P-Test ..... 127
20.4 Direct Comparison Test for Series ..... 129
20.5 Limit Comparison Test for Series ..... 130
20.5.1 Estimating Sums of Series Using Comparison Series ..... 132
20.5.2 ICE - Comparison Tests ..... 133
20.6 The Alternating Series Test ..... 135
20.6.1 Estimating Remainders in Alternating Series ..... 136
20.7 Absolute Convergence Test and Conditional Convergence ..... 137
20.7.1 ICE - Alternating Series Test ..... 139
20.8 The Ratio Test ..... 141
20.9 The Root Test ..... 142
20.9.1 ICE - Ratio and Root Tests ..... 145
21 Series Review ..... 147
21.1 Flowchart Summarizing Most Series Convergence Tests ..... 153
21.2 Infinite Series Convergence Testing Practice ..... 155
22 Power Series ..... 157
22.1 Differentiating and Integrating Power Series ..... 161
22.2 ICE - Power Series ..... 163
22.3 Using Power Series to Represent Functions ..... 166
22.4 ICE -Introduction to Taylor Series ..... 169
23 Taylor Series ..... 171
23.1 The Binomial Series ..... 172
23.2 Using Known Maclaurin Series ..... 173
23.3 Using Taylor Polynomials ..... 175
23.4 Remainder Theorem/Error Analysis for Taylor Series ..... 176
23.5 ICE -Taylor Series ..... 179
24 Differential Equations ..... 183
24.1 Brief Introduction to Differential Equations ..... 183
24.1.1 Law of Natural Growth/Decay ..... 184
24.1.2 Newton's Law of Cooling ..... 185
24.1.3 Continuous Compounded Interest ..... 186
24.2 General Differential Equations ..... 187
24.3 Optional Topic: Solving First-Order Linear Differential Equations ..... 190
24.4 ICE -Differential Equations ..... 193
24.5 Slope Fields ..... 195
24.5.1 ICE -Slope Fields ..... 199
A Practice Problems and Review for Exams ..... 201
A. 1 Practice Problems for Exam 1 ..... 203
A. 2 Practice Problems for Exam 2 ..... 211
A. 3 Practice Problems for Exam 3 ..... 215
A. 4 Practice Problems for Exam 4 ..... 219
B Homework ..... 223
B. 1 Calculus II HW 1: Due Tues $9 / 5$ Name: ..... 225
B. 2 Calculus II HW 2: Due Tues 9/12 Name: ..... 227
B. 3 Calculus II HW 3: Due Tues 9/19 Name: ..... 229
B. 4 Calculus II HW 4: Due Tues $10 / 3$ Name: ..... 233
B. 5 Calculus II HW 5: Due Tues 10/10 Name: ..... 237
B. 6 Calculus II HW 6: Due Tues 10/17 Name: ..... 241
B. 7 Calculus II HW 7: Due Fri 10/27 Name: ..... 245
B. 8 Calculus II HW 8: Due Tues 10/31 Name: ..... 249
B. 9 Calculus II HW 9: Due Tues 11/7 Name: ..... 253
B. 10 Calculus II HW 10: Due Tues 11/21 Name: ..... 257
B. 11 Calculus II HW 11: Due Tues 11/28 Name: ..... 259
B. 12 Calculus II HW 12: Due Tues 12/5 Name: ..... 261
B. 13 Calculus II HW 13: Due Fri 12/8 Name: ..... 265

## 1 Syllabus and Schedule

Thanks for taking Calculus II with me! It is my favorite class to teach and it is the best course of the calculus sequence (in my opinion). You may be asking yourself (or have asked yourself), "What is Calculus, and why do I have to take this class?" Calculus is, in my opinion, ultimately is the study of change. In particular, calculus gives us the tools to be able to understand how changing one or more linked variables reflects change in other variables ${ }^{1}$. In other words, Calculus is the study and modeling of dynamical systems ${ }^{2}$. In Calculus I, we learned about the derivative of a function and some of its applications. Recall, a derivative is a measure of sensitivity of change in one variable to change in the other -the instantaneous rate of change. When we learn about integration, we are measuring accumulation or the limit of a summation of smaller parts ${ }^{2}$. In Calculus II, we will build upon this idea that we can use integrals to calculate and model complex situations by accumulating the sums of simpler parts. We will also learn techniques used in calculating and approximating these integrals and discuss ways of modeling functions and infinite systems.

I hope you will enjoy this semester and learn a lot! Please make use of my office hours and plan to work hard in this class. My classes have a high work load (as all math classes usually do!), so make sure you stay on top of your assignments and get help early. Remember you can also email me questions if you can't make my office hours or make an appointment outside of office hours for help. When I am at Lewis, I usually keep the door open and feel free to pop in at any time. If I have something especially pressing, I may ask you to come back at a different time, but in general, I am usually available. The HW Assignments, and Practice Problems for Exams are at the end of this course packet. I have worked hard to create this course packet for you, but it is still a work in progress. Please be understanding of the typos I have not caught, and politely bring them to my attention so I can fix them for the next time I teach this course. I look forward to meeting you and guiding you through the magnificent course that is Calculus II.

Cheers,
Dr. H

Acknowledgments: No math teacher is who she is without a little help. I would like to thank my own undergraduate professors from Taylor University: Dr. Ken Constantine, Dr. Matt Delong, and Dr. Jeremy Case for their wonderful example and ideas for structuring excellent learning environments. I want to thank the members from both the MAA META Math the MathVote and Projects ( https://www.maa.org/programs-and-communities/curriculum\ resources/meta-mathand http://mathquest.carroll.edu/) for sharing some of their clicker questions. I also want to thank Dr. Ryan Hooper and Dr. Danielle Champney their problem sequences from their own courses. And finally, I would like to thank you and all the other students for making this job worthwhile and for all the suggestions and encouragement you have given me over the years to improve. (C)Harsy

[^0]
## 2 Syllabus Crib Notes

The full syllabus is posted in Blackboard. Here are some highlights from the syllabus:

### 2.1 Office Hours

Please come to my office hours! Helping you with the material is the best part of my job! I have set weekly office hours which I hold and I encourage you to instead make appointments for me to meet with you at a time that works for both of us! My office is in SB-144. Remember if none of these times work, send me an email and we can schedule another time to meet. I can also answer questions through email!

Note: Sometimes I have meetings or class that goes right up to my office hours, so if I am not there, please wait a few minutes. Also sometimes I have unexpected meetings that get scheduled during my office hours. If this happens, I will do my best to let you know as soon as possible and I usually hold replacement office hours.

Help: Don't wait to get help. Visit me during my office hours, use the discussion forum in Blackboard, go to the Math Study Tables, find a study partner, get a tutor!

### 2.2 Grades

| Category | Percentage | Exam \# | Date |
| :---: | :---: | :---: | :---: |
| Quizzes | 10 | 1 | $9 / 23$ |
| Homework Takehome | 15 | 2 | $10 / 18$ |
| Knewton Alta Homework | 10 | 3 | $11 / 10$ |
| Exams | 65 | 4 | $12 / 6$ |

Final Exam: We will not have a formal final exam. Instead Finals week will be a final Testing Week (see description above under Master-Based Testing).

Homework: Almost every week, I will collect a homework assignment. I will post these homework assignments on Blackboard. You may work with others on the homework, but it must be your own work. If I catch you copying homework, you will get a 0 . Please see the academic honesty section in the posted syllabus in Bb .

### 2.2.1 Exams

### 2.3 Expectations

This is a college level Math class and is much different than one taught in high school. We cover a lot of (very different) material in a very limited class time. You cannot expect to be able to pass this class if you do not spend several hours every day reading the sections and working problems
outside of class. Paying attention and taking notes only during class time will not be enough. After the problems are worked, find a common thread, idea, or technique.

Calculator Policy: No calculators or other forms of technology can be used on in-class, closedbooks assessments (quizzes, tests, final).

Academic Integrity: Scholastic integrity lies at the heart of Lewis University. Plagiarism, collusion and other forms of cheating or scholastic dishonesty are incompatible with the principles of the University. This includes using "tutoring"" sites for homework, quizzes, and exams. Students engaging in such activities are subject to loss of credit and expulsion from the University. Cases involving academic dishonesty are initially considered and determined at the instructor level. If the student is not satisfied with the instructor's explanation, the student may appeal at the department/program level. Appeal of the department /program decision must be made to the Dean of the college/school. The Dean reviews the appeal and makes the final decision in all cases except those in which suspension or expulsion is recommended, and in these cases the Provost makes the final decision.

Make-Ups: There will be no make-ups for any assignments. If you are late or miss class, your assignment will not be accepted and there will be no make-up offered, except in extenuating and unpredictable circumstances. If you will miss class for a justifiable \& unavoidable reason, you can contact me before you miss class \& it is possible you can have a make-up. If you do not contact me \& explain your absence, you will not be allowed a make-up.

Dr. Harsy's web page: For information on undergraduate research opportunities, about the Lewis Math Major, or about the process to get a Dr. Harsy letter of recommendation, please visit my website: http://www.cs.lewisu.edu/~harsyram.

Blackboard: Check the Blackboard website regularly (at least twice a week) during the semester for important information, announcements, and resources. It is also where you will find the course discussion board. Also, check your Lewis email account every day. I will use email as my primary method of communication outside of office hours.

The full syllabus and schedule is subject to change and the most updated versions are posted in the Blackboard.

Calculus II Schedule Fall 2023
The table below outlines the tentative topics to be covered each day and quiz and homework due dates. You also have Knewton Alta HW due most Wednesdays and Fridays. This schedule is subject to change.

| Monday | Tuesday | Wednesday | Friday |
| :---: | :---: | :---: | :---: |
| 8/28 Intro, Review | 8/29 Review | $8 / 30$ <br> Hyperbolic Functions | $9 / 1$ <br> Average Value of an Integral |
| $\begin{array}{r} \hline 9 / 4 \\ \\ \hline \end{array}$ | $9 / 5$ <br> Integration By Parts HW 1 Due | $\begin{aligned} & \text { 9/6 } \\ & \text { Integration By Parts cont } \end{aligned}$ | $9 / 8$ <br> Trig Integration |
| $9 / 11$ <br> Trig Integration cont. | $9 / 12$ <br> Inverse Trig Sub HW 2 Due | $9 / 13$ <br> Inverse Trig Sub Cont | $9 / 15$ <br> Partial Fractions |
| $\begin{aligned} & \text { 9/18 } \\ & \quad \text { Partial Fractions Cont. } \end{aligned}$ | $9 / 19$ <br> Strategy for Integration <br> HW 3 Due | $9 / 20$ <br> Review Quiz 1 | 9/22 Exam 1 |
| $9 / 25$ <br> Numerical Integration | $9 / 26$ <br> Numerical Integration cont | $9 / 27$ <br> Volumes Washer Method | $\begin{aligned} & \text { 9/29 } \\ & \text { Volumes Shell Method I } \end{aligned}$ |
| 10/2 Volumes cont. | $10 / 3$ <br> Arc Length HW 4 Due | $10 / 4$ <br> Surface Area . | $10 / 6$ <br> Fall Break, no class |
| $10 / 9$ <br> Work <br> Retesting Week | $10 / 10$ <br> Work cont.. <br> HW 5 Due <br> Retesting Week | $10 / 11$ <br> Hydrostatic Force <br> Retesting Week | $10 / 13$ <br> Improper Integrals <br> Retesting Week |
| $10 / 16$ <br> Improper Integrals cont. Quiz 2 | $10 / 17$ <br> Review HW 6 Due | $10 / 18$ <br> Sequences (not on Exam 2) | $10 / 20$ <br> Exam 2 |
| $10 / 23$ <br> Sequences cont. <br> Retesting Week | $10 / 24$ <br> Series <br> Retesting Week | $10 / 25$ <br> Series cont. <br> Retesting Week | $10 / 27$ <br> Integral Test <br> HW 7 Due <br> Retesting Week |
| $10 / 30$ <br> Integral Test cont | $10 / 31$ <br> Comparison Tests HW 8 Due | 11/1 <br> Alternating Series | $11 / 3$ <br> Ratio \& Root Test |
| 11/6 Strategy for Series | $11 / 7$ <br> Strategy for Series cont. HW 9 Due | 11/8 <br> Flex Day Quiz 3 | $11 / 10$ <br> Exam 3 |
| $11 / 13$ <br> Power Series <br> Retesting Week | $11 / 14$ <br> Power Series cont Retesting Week | $11 / 15$ <br> Functions as Series Retesting Week | $11 / 17$ <br> Taylor Series Retesting Week |

| $11 / 27$ <br> Taylor Series Modeling cont. | $11 / 28$ <br> Exponential Growth/Decay HW 11 Due | $11 / 29$ <br> Differential Equations | 12/1 <br> Differential Equations cont. Quiz 4 |
| 12/4 Slope Fields | 12/5 <br> Optional: First Order Differential Equations HW 12 Due | $12 / 6$ <br> Exam 4 | 12/8 <br> Bonus Quiz <br> Cumulative Quiz 5 <br> HW 13 Due |
| $12 / 11$ <br> Retesting Week | $12 / 12$ <br> Retesting Week | $i 12 / 13$ <br> Retesting Week | $\begin{array}{rr} \hline \text { 12/14 } & \\ \text { Retesting Week } \\ \text { Final Exam } \\ \text { 10:30am-12:30pm } \\ \hline \end{array}$ |

## Assessment and Mapping of Student Learning Objectives:

## Baccalaureate Characteristics:

BC 1. The baccalaureate graduate of Lewis University will read, write, speak, calculate, and use technology at a demonstrated level of proficiency.

Measurable Student Learning Outcome:
Advocate for a cause or idea, presenting facts and arguments, in an organized and accurate manner using some form of technology. Include qualitative and quantitative reasoning.

| Course Student Learning Objectives | Baccalaureate Characteristic | Demonstrated by |
| :---: | :---: | :---: |
| 1. Find the average value of an integral. | 1-Reinforced | Homework, Exams, Quizzes |
| 2. Match a given direction eld with a corresponding differential equation. | 1-Reinforced | Homework, Exams, Quizzes |
| 3. Recognize integrands for which integration by parts is appropriate. | 1-Reinforced | Homework, Exams, Quizzes |
| 4. Perform integration by parts. | 1-Reinforced | Homework, Exams, Quizzes |
| 5. Apply techniques for integrals of products and higher powers of sines and cosines. | 1-Reinforced | Homework, Exams, Quizzes |
| 6. Apply techniques for integrals of secants and tangents, and for cosecants and cotangents. | 1-Reinforced | Homework, Exams, Quizzes |
| 7. Apply techniques of trigonometric substitution to integrate various forms of integrands. | 1-Reinforced | Homework, Exams, Quizzes |
| 8. Apply the technique of partial fraction decomposition to reduce an integrand to a more easily integrated form. | 1-Reinforced | Homework, Exams, Quizzes |
| 9. Given a random integration problem, choose the proper method and proceed with integration. | 1-Reinforced | Homework, Exams, Quizzes |
| 10. Solve separable differential equations. | 1-Reinforced | Homework, Exams, Quizzes |
| 11. Integrate and differentiate hyperbolic trigonometric functions.. | 1-Reinforced | Homework, Exams, Quizzes |
| 12. Approximate definite integrals using numerical integration techniques and solve related problems. | 1-Reinforced | Homework, Exams, Quizzes |
| 13. Apply slicing and integration techniques to calculate volumes, work, hydrostatic force, arc length, and surface area. | 1-Reinforced | Homework, Exams, Quizzes |
| 14. Recognize improper integrals and put them in proper form for determination. | 1-Reinforced | Homework, Exams, Quizzes |
| 15. Determine if an improper integral diverges or converges (and if so, to what?). | 1-Reinforced | Homework, Exams, Quizzes |
| 16. Identify and compare different types of sequences. | 1-Reinforced | Homework, Exams, Quizzes |
| 17. Determine if a sequence diverges or converges (and if so, to what?). | 1-Reinforced | Homework, Exams, Quizzes |
| 18. Apply infinite series tests for convergence and divergence. | 1-Reinforced | Homework, Exams, Quizzes |
| 19. Determine the error associated with a partial sum of an alternating series. | 1-Reinforced | Homework, Quizzes |
| 20. Find the interval of convergence and radius of convergence for a given power series. | 1-Reinforced | Homework, Exams, Quizzes |
| 21. Generate power series representations of some functions from a geometric series perspective. | 1-Reinforced | Homework, Quizzes |
| 22. Generate power series representations of some functions from a Taylor Series perspective. | 1-Reinforced | Homework, Exams, Quizzes |
| 23. Recognize and manipulate important Maclaurin Series using differentiation, integration, and substitution. | 1-Reinforced | Homework, Quizzes |
| 24. Find the $n^{\text {th }}$ degree Taylor Polynomial of a function $f$ at a point $a$ and determine the error associated with the estimate. | 1-Reinforced | Homework, Quizzes |

## 3 Review Calculus I

Recall the following derivatives:

| Function | $\sin x$ | $\cos x$ | $\tan x$ | $\csc x$ | $\sec x$ | $\cot x$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Derivative |  |  |  |  |  |  |

1. The Math Cat Posse: Eva, Archer, Periwinkle, Delilah, and Mako are trying to remember their Calculus I as they work to differentiate the following functions. With a partner or in small groups, describe why each cat's solution is problematic (if at all) and find the correct derivative.
(a) $y=\sec \left(x^{2}\right) \quad$ Correct Solution:
Archer's Solution:
$y^{\prime}=\sec \left(x^{2}\right) \tan \left(x^{2}\right)$
Periwinkle's Solution:
$y^{\prime}=2 x \sec \tan \left(x^{2}\right)$
(b) $f(x)=x^{3} \tan (x) \quad$ Correct Solution:

Mako's Solution:
$f^{\prime}(x)=3 x \sec ^{2}(x)$
(c) $y=\frac{1}{x^{5}}-\sqrt[4]{x-x^{3}}+x-\pi^{2} \quad$ Correct Solution:

Delilah's Solution:
$y^{\prime}=\frac{1}{x^{4}}-(1-3 x) \sqrt[3]{x-x^{3}}+1-2 \pi$
(d) $k(x)=\frac{x^{3}}{\cos (x)+1} \quad$ Correct Solution:

Archer's Solution:
$k^{\prime}(x)=\frac{3 x^{2}}{-\sin (x)}$

Eva's Solution:
$k^{\prime}(x)=\frac{3 x^{2}}{\cos x+1}+\frac{x^{3} \sin x}{(\cos x+1)^{2}}$
2. Integrate the following functions:
a) $\int\left(\frac{1}{x^{3}}-\sqrt[5]{x}+x-1\right) d x$
b) $\int_{1}^{5} \frac{x^{7}-x^{2}}{x} d x$
c) $\int x^{5} \sec ^{2}\left(x^{6}\right) d x$
d) $\int \sec ^{2} x \tan x d x$
3. What is differentiation used for?
4. What does the derivative represent?
5. What does the integral represent?
6. Differentiate: $y^{2}=x \sin (y)-x^{7}$
7. If the position function of a particle is given by $p(t)=t^{3}-4 t+\cos (t)$, find the acceleration function.

## 4 Hyperbolic Functions

### 4.1 Introduction of Hyperbolic Functions

You may remember from other math classes that we can represent the points of the unit circle using parametric equations. That is, each point $(x, y)$ on the circle can be represented by
$\qquad$ . [We will cover this more in Calc 3.]. We can do the same with the unit hyperbola.
Recall a hyperbola is a curve of the form $\frac{x^{2}}{a^{2}}-\frac{y^{2}}{b^{2}}=1$.

We can represent each point on the right half of the unit hyperbola $x^{2}-y^{2}=1$ as a point:
What are these weird functions? They arise from combinting the exponential functions $e^{x}$ and $e^{-x}$ and are analogous to trig functions.

| Hyperbolic Functions |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Function | Notation | Definition | Domain | Range |
| Hyperbolic Sine <br> $\cdot$ | $\sinh (x)$ |  | $(-\infty, \infty)$ | $(-\infty, \infty)$ |
| $\cdot$ |  |  | $(-\infty, \infty)$ | $[1, \infty)$ |
| Hyperbolic Cosine <br> $\cdot$ | $\cosh (x)$ |  | $(-\infty, \infty)$ | $(-1,1)$ |
| Hyperbolic Tangent <br> $\cdot$ | $\tanh (x)$ |  | $(-\infty, 0) \cup(0, \infty)$ | $(-\infty, 0) \cup(0, \infty)$ |
| Hyperbolic Cosecant <br> $\cdot$ | $\operatorname{csch}(x)$ |  | $(-\infty, \infty)$ | $(0,1)$ |
| Hyperbolic Secant <br> $\cdot$ | $\operatorname{sech}(x)$ |  | $(-\infty, 0) \cup(0, \infty)$ | $(-\infty,-1) \cup(1, \infty)$ |
| Hyperbolic Cotangent <br> $\cdot$ | $\operatorname{coth}(x)$ |  |  |  |

| Inverse Hyperbolic Functions |  |  |  |  |  |
| :--- | :--- | :---: | :--- | :--- | :---: |
| Function | Notation | Definition | Domain | Range |  |
| Inverse Hyperbolic Sine | $\sinh ^{-1}(x)$ or arcsinh x | $\ln \left(x+\sqrt{x^{2}+1}\right)$ | $(-\infty, \infty)$ | $(-\infty, \infty)$ |  |
| Inverse Hyperbolic Cosine | $\cosh ^{-1}(x)$ or $\operatorname{arccosh} \mathrm{x}$ | $\ln \left(x+\sqrt{x^{2}-1}\right)$ | $[1, \infty)$ | $[0, \infty)$ |  |
| Inverse Hyperbolic Tangent | $\tanh ^{-1}(x)$ or $\operatorname{arctanh} \mathrm{x}$ | $\frac{1}{2} \ln \left(\frac{1+x}{1-x}\right)$ | $(-1,1)$ | $(-\infty, \infty)$ |  |
| Inverse Hyperbolic Cosecant | $\operatorname{csch}^{-1}(x)$ or arccsch x | $\ln \left(\frac{1}{x}+\sqrt{\frac{1}{x}+1}\right)$ | $(-\infty, 0) \cup(0, \infty)$ | $(-\infty, 0) \cup(0, \infty)$ |  |
| Inverse Hyperbolic Secant | $\operatorname{sech}^{-1}(x)$ or arcsech x | $\ln \left(\frac{1}{x}+\sqrt{\frac{1}{x}-1}\right)$ | $(0,1)$ | $[0, \infty)$ |  |
| Inverse Hyperbolic Cotangent | $\operatorname{coth}^{-1}(x)$ or arccoth x | $\frac{1}{2} \ln \left(\frac{1+x}{x-1}\right)$ | $(-\infty,-1) \cup(1, \infty)$ | $(-\infty, 0) \cup(0, \infty)$ |  |

## Graphs of Hyperbolic Functions and Their Inverse Functions

1) $\sinh (-x)=$
2) $\cosh (a \pm b)=\cosh a \cosh b \pm \sinh a \sinh b$
3) $\cosh (-x)=$
4) $\operatorname{coth}^{2} x-1=\operatorname{csch}^{2} x$
5) $\cosh ^{2} x-\sinh ^{2} x=$
6) $1-\tanh ^{2} x=\operatorname{sech}^{2} x$
7) $\sinh (a \pm b)=\sinh a \cosh b \pm \cosh a \sinh b$

### 4.2 Derivatives of Hyperbolic Functions and their Inverses

Example 4.1. Determine $\frac{d}{d x} \sinh x$.

Example 4.2. Determine $\frac{d}{d x} \cosh x$.

## Derivatives of Hyperbolic Functions

1) $\frac{d}{d x}(\sinh x)=$
2) $\frac{d}{d x}(\cosh x)=$
3) $\frac{d}{d x}(\tanh x)=$
4) $\frac{d}{d x}(\operatorname{csch} x)=$
5) $\frac{d}{d x}(\operatorname{sech} x)=$
6) $\frac{d}{d x}(\operatorname{coth} x)=$

Neat! We get similar derivative relationships like we have for trig functions!
Example 4.3. Differentiate $y=\sinh (\cosh x)$.

We can derive derivatives of inverse hyperbolic functions in ways that are similar to finding derivatives of inverse trig functions. That is we let $y=\cosh ^{-1} x \Rightarrow x=\cosh y$ and use implicit differentiation and hyperbolic function identities to determine $\frac{d}{d x} \cosh ^{-1} x$.

## Derivatives of Inverse Hyperbolic Functions

1) $\frac{d}{d x}\left(\sinh ^{-1} x\right)=$
2) $\frac{d}{d x}\left(\cosh ^{-1} x\right)=$
3) $\frac{d}{d x}\left(\tanh ^{-1} x\right)=$
4) $\frac{d}{d x}\left(\operatorname{csch}^{-1} x\right)=$
5) $\frac{d}{d x}\left(\operatorname{sech}^{-1} x\right)=$
6) $\frac{d}{d x}\left(\operatorname{coth}^{-1} x\right)=$

Example 4.4. Differentiate $y=\sinh ^{-1}(2 x)$.

### 4.3 Antiderivatives of Hyperbolic Functions and their Inverses

We can use our derivatives to find corresponding antiderivatives. Here are the ones you should memorize.

1. $\int \cosh x d x=$
2. $\int \sinh x d x=$
3. $\int \operatorname{sech}^{2} x d x=$
4. $\int \frac{1}{\sqrt{1+x^{2}}} d x=$
5. $\int \frac{1}{\sqrt{x^{2}-1}} d x=$
6. $\int \frac{1}{1-x^{2}} d x=$

Example 4.5. Evaluate $\int \frac{\cosh x}{\cosh ^{2} x-1} d x$.

### 4.4 ICE - Hyperbolic Functions

1. Differentiate $y=x \sinh (\sin x)$.
2. Differentiate $y=\cosh ^{-1}(\sqrt{3 x})$.
3. Evaluate $\int \frac{e^{x}}{1-e^{2 x}} d x$.
4. Evaluate $\int \frac{e^{x}}{1+e^{2 x}} d x$.
5. Evaluate $\int_{0}^{1} \frac{1}{\sqrt{16 x^{2}+1}} d x$
6. Show that $\frac{d}{d x} \arctan (\tanh x)=\operatorname{sech}(2 x)$

## 5 Average Value

### 5.1 Net Change

Recall that definite integrals can return positive or negative values depending on whether or not the function is above or below the $x$-axis.
$\int_{0}^{2 \pi} \sin x d x=$

What if instead of finding the net area, we wanted to find the total area between a function $f$ and the $x$-axis?

- Subdivide $[a, b]$ into intervals where $f(x)$ is positive and where $f(x)$ is negative
- Integrate over each subinterval
- Sum up the integral of each subinterval

Total area between $\sin x$ and the $x$-axis:

Example 5.1. Find the total area between $f(x)=x^{3}-4 x$ and the $x$-axis on $[-2,2]$.

The Net Change Theorem: The integral of a rate of change is the net change:

This principle can be applied to many rates of change in the natural and social sciences.
Example 5.2. a) Suppose $V(t)$ is the volume of water in a reservoir at time $t$. Then its derivative $V^{\prime}(t)$ is
b) If $C(t)$ is the concentration of the product of a chemical reaction at time $t$, then $C^{\prime}(t)$ is
c) If the rate of growth of a population is $d n / d t$, then

$$
\int_{t_{1}}^{t_{2}} \frac{d n}{d t} d t=n\left(t_{2}\right)-n\left(t_{1}\right)
$$

### 5.2 Average Value of a Function

If I were to get an $80 \%, 78 \%$, and $90 \%$ on my first 3 calculus exams, I can find my average exam grade by

Finding the average value of finitely many numbers is easy. It is just:
But suppose we want to find the average value of a constantly changing function $f(x)$ over an interval $[a, b]$

Definition: Average Value of a Function: The average value of $f$ on the interval $[a, b]$ is given by $f_{\text {ave }}=$

Example 5.3. Find the average value of $g(x)=\frac{3}{(1+x)^{2}}$ on the interval $[1,4]$.

Example 5.4. Suppose the temperature $T$ (in degrees Celsius) of a metal bar of length 2 m depends
on position $x$ (in meters) is given by the function $T(x)=40+20 x(2-x)$.
a) Find the average temperature of the bar.
b) At what position(s) on the metal bar is the temperature equal to the average temperature of the bar?

### 5.3 Mean Value Theorem for Integrals

Will a function always achieve its average value on $[a, b]$ ?
Defintion: The Mean Value Theorem for Integrals: If $f$ is $\qquad$ on $[a, b]$, then there exists a number $c$ in $[a, b]$ such that $f(c)=f_{\text {ave }}=$ In other words:
and we can geometrically interpret this:

Example 5.5. Use your answer in Example 5.3, to determine the value $c$ such that $g(c)=g_{\text {ave }}$. Then sketch the graph of $g$ and a rectangle whose area is the same as the area under the graph of $g$.

Example 5.6. If $f$ is continuous and $\int_{3}^{5} f(x) d x=6$, show that $f$ takes on the value of 3 at least once on the interval $[3,5]$.

### 5.4 ICE- Average Value

1. Let $f(x)=3-x^{2}$
(a) Find the average value of $f(x)$ on the interval $[0, \sqrt{3}]$. Call this value $k$.
(b) Sketch the graph of $y=f(x)$ and $y=k$.

(c) Show that on the interval $[0, \sqrt{3}]$, the amount of area that lies below $y=f(x)$ and above $y=k$ is equal to the amount of area that lies below $y=k$ and above $y=f(x)$.
(d) Will the result of the previous question be true for any continuous function and its average value on any interval? Why?
2. Find the numbers $b$ such that the average value of $f(x)=3 x^{2}-4 b-10$ on the interval $[0, b]$ os equal to 5 .

## 6 Integration By Parts

Un-doing the Product Rule

Integration by substitution corresponds with the differentiation rule:
Today we will learn the "product rule" for integration. First what is our product rule?

Integration by Parts:
$\int f(x) g^{\prime}(x) d x=$
$\int u d v=$
$\int_{a}^{b} u d v=$
Note: We usually wait until the end to add the constant of integration.

Example 6.1. Evaluate $\int_{1}^{4} x e^{x} d x$.

Example 6.2. Evaluate $\int x^{2} \cos (x) d x$.

Example 6.3. Evaluate $\int \ln x d x$.

Integral of Natural Log: $\int \ln x d x=$
Integral of Log: $\int \log _{b} x d x=x \log _{b}(x)-\frac{1}{\ln (b)} x+C$

### 6.1 Strategy for Integration By Parts

What type of functions do we want to pick for our $u$ and $d v$ ? How do you choose?
For our $u$ :
For our $d v$ :

Helpful Acronym: LIATE
Logarithmic Inverse Trigonometric Algebraic Trigonometric Exponential

Example 6.4. Determine which functions make sense for $u$ and for $d v$ :
a) $\int x^{2} 3^{x} d x$
b) $\int \arcsin x d x$
c) $\int\left(x^{2}+5 x-2\right) e^{x} d x$
d) $\int x \sec ^{2} x d x$
e) $\int x \ln (x+2) d x$
f) $\int x^{4} \sinh x d x$

### 6.2 Cycling Integrals

Sometimes integration by parts seems to not be working... but it is...
Cycling integrals often occurs when both $u$ and $d v$ don't change much when you differentiate or integrate. Or when it seems like you keep getting almost the same thing OVER AND OVER Again.

Example 6.5. Evaluate $\int e^{x} \cos (2 x) d x$.

Example 6.6. Evaluate $\int(\tan x)^{2} d x$.

Example 6.7. Evaluate $\int \sin (\ln x) d x$.

### 6.3 ICE - Integration By Parts

2 sides!

1. Evaluate $\int x \sin (3 x) d x$
2. Evaluate $\int \arctan x d x$
3. Use integration by parts to prove $\int x^{n} e^{x} d x=x^{n} e^{x}-n \int x^{n-1} e^{x} d x$. Then use it to evaluate $\int x^{3} e^{x} d x$.
4. Evaluate $\int \frac{x}{x^{2}+9} d x$
5. Can I use any of my methods for integration to evaluate $\int \frac{4 x+10}{x^{2}+2 x-8} d x$ ? Why?
6. Can I use any of my methods for integration to evaluate $\int \tan ^{2} x d x$ ? Why?
7. Evaluate $\int_{0}^{2} \ln \left(5^{x}\right) 5^{x} d x$ [Hint: Careful, do we need integration by parts?].
8. Evaluate $\int 2^{\sqrt{x}} d x$ [Hint: Substitute first ].

## 7 Integration Techniques for Higher Trig Functions

Suppose we want to evaluate $\int \tan ^{2} x d x$. What can we do?
$\int \tan ^{2} x d x$

Often when we have integrals with higher powers of trigonometric functions, we need to use trigonometric identities to solve them.

### 7.1 Trig Identities

Here are some some of the main identities we will use.

## Basic Identities

$\sin ^{2} \theta+\cos ^{2} \theta=1$
$1+\tan ^{2} \theta=\sec ^{2} \theta$
$1+\cot ^{2} \theta=\csc ^{2} \theta$

## Power reduction formulas <br> $\sin ^{2} \theta=\frac{1}{2}(1-\cos (2 \theta))$ $\cos ^{2} \theta=\frac{1}{2}(1+\cos (2 \theta))$

Double-angle formulas
$\sin (2 \theta)=2 \sin \theta \cos \theta$
$\cos (2 \theta)=\cos ^{2} \theta-\sin ^{2} \theta$
$=1-2 \sin ^{2} \theta$
$=2 \cos ^{2} \theta-1$

$$
\begin{aligned}
& \sin (\theta \pm \phi)=\sin \theta \cos \phi \pm \cos \theta \sin \phi \\
& \cos (\theta \pm \phi)=\cos \theta \cos \phi \mp \sin \theta \sin \phi \\
& \sin (A) \cos (B)=\frac{\sin (A-B)+\sin (A+B)}{2} \\
& \sin (A) \sin (B)=\frac{\cos (A-B)-\cos (A+B)}{2} \\
& \cos (A) \cos (B)=\frac{\cos (A-B)+\cos (A+B)}{2}
\end{aligned}
$$

## Addition Formulas

### 7.2 Strategy for Integrating Powers of Sine and Cosine

Strategy for Evaluating $\int \sin ^{n} x \cos ^{m} x d x$ :
Case 1: If the power of cosine is odd, save one cosine factor and use Then use substitution of $w=\sin x$. See Example 1 .

Case 2: If the power of sine is odd, save one sine factor and use Then use substitution of $w=\cos x$. See Example 3.

Case 3: If the both powers of sine and cosine are even, use our Power Reduction Formulas: $\sin ^{2} x=\frac{1}{2}(1-\cos (2 x))$ or $\cos ^{2} x=\frac{1}{2}(1+\cos (2 x))$
** Notice except for Case 3, we are preparing our integral for substitution by pulling out our substitution for $d w$.

Example 7.1. Evaluate $\int \cos ^{3} x \sin ^{-2} x d x$.

Example 7.2. Evaluate $\int \cos ^{4} x d x$.

Example 7.3. Evaluate $\int \sin ^{5} x d x$.

### 7.3 Strategy for Integrating Powers of Tangent and Secant

Now suppose we have an integral of the form $\int \tan ^{n} x \sec ^{m} x d x$, what derivatives could we see in this product?

Strategy for Evaluating $\int \tan ^{n} x \sec ^{m} x d x$ :
Case 1: If the power of tangent is odd and you have at least one secant, save one $\sec x \tan x$ factor and use So that the rest of the integral is only in terms of secant (except for our one saved $\sec x \tan x$ factor). Then use substitution of $w=\sec x$. See Example 5.

Case 2: If the power of secant is even, save one $\sec ^{2} x$ factor and use
So that the rest of the integral is only in terms of tangent (except for our one saved $\sec ^{2} x$ factor). Then use substitution of $w=\tan x$.

If Case 1 and Case 2 don't apply, you need to be creative (e.g. $\int \tan ^{2} x d x$ ) or use substitution (e.g. $\int \tan x d x$ ).

Example 7.4. Evaluate $\int \tan ^{3} x \sec x d x$.

Example 7.5. Evaluate $\int \sec x d x$.

### 7.4 Strategy for Integrating Powers of Cotangent and Cosecant

Strategy for Evaluating $\int \cot ^{n} x \csc ^{m} x d x$ :
*Note these are analogous to tangent and secant.
Case 1: If the power of cotangent is odd and you have at least one cosecant, save one $\csc x \cot x$ factor and use
So that the rest of the integral is only in terms of cosecant (except for our one saved $\csc x \cot x$ factor). Then use substitution of $w=\csc x$.

Case 2: If the power of cosecant is even, save one $\csc ^{2} x$ factor and use
So that the rest of the integral is only in terms of cotangent (except for our one saved $\csc ^{2} x$ factor). Then use substitution of $w=\cot x$.

If Case 1 and Case 2 don't apply, you need to be creative. (for example $\int \csc x d x$ )
Example 7.6. Evaluate $\int \cot ^{4} x \csc ^{4} x d x$

### 7.5 Using Addition Trigonometric Properties

When we have integrals of the form $\int \sin (a x) \cos (b x) d x, \int \sin (a x) \sin (b x) d x$, or $\int \cos (a x) \cos (b x) d x$, we need to use the addition properties of trig functions.

Example 7.7. $\int \sin (8 x) \cos (3 x) d x$

### 7.6 ICE - Higher Trig Techniques for Integration

2 sides!

1. Evaluate $\int 4 x^{3} \tan \left(2 x^{4}\right) \sec ^{3}\left(2 x^{4}\right) d x$ (What do you do first?)
2. Evaluate $\int(1+\sin (3 x))^{2} d x$
3. Evaluate $\int \sin ^{3} x \sqrt{\cos x} d x$
4. Evaluate $\int \cos x \cot ^{2} x d x$

## 8 Inverse Trigonometric Substitution Techniques for Integration

How would we evaluate $\int \frac{x}{\sqrt{x^{2}+4}} d x$ ?
How about $\int \frac{1}{\sqrt{x^{2}+4}} d x$ ?
How about $\int \frac{1}{\sqrt{3-x^{2}}} d x$ ?
What problem do we have when we try to evaluate $\int \frac{1}{x^{2} \sqrt{x^{2}+4}} d x$ ? or $\int \frac{1}{\left(4-x^{2}\right)^{\frac{3}{2}}} d x$
In this section we are going to again use the main trig identities used to simplify trigonometric integrals from the previous section.
These are:

Which form does $4-x^{2}$ "somewhat" look like?
Let's consider the following substitution:

Example 8.1. Use this substitution to evaluate $\int \frac{1}{\left(4-x^{2}\right)^{\frac{3}{2}}} d x$.

This technique is called $\qquad$

### 8.1 Strategy for Inverse Trigonometric Substitution

Case 1: We see the expression $\sqrt{a^{2}+x^{2}}$, we use the substitution $\qquad$ (with the restricted domain $\left[\frac{-\pi}{2}, \frac{\pi}{2}\right]$ ) Then we will use the identity: $1+\tan ^{2} \theta=\sec ^{2} \theta$ picture:

Case 2: We see the expression $\sqrt{a^{2}-x^{2}}$, we use the substitution $\qquad$ (with the restricted domain $\left[\frac{-\pi}{2}, \frac{\pi}{2}\right]$ ) Then we will use the identity: $1-\sin ^{2} \theta=\cos ^{2} \theta$ picture:

Case 3: We see the expression $\sqrt{x^{2}-a^{2}}$, we use the substitution $\qquad$ (with the restricted domain $[0, \pi]$ or $\left[0, \frac{\pi}{2}\right) \cup\left[\pi, \frac{3 \pi}{2}\right)$ )
Then we will use the identity: $\sec ^{2} \theta-1=\tan ^{2} \theta$
picture:

Note: This method is usually used for integrals with $\sqrt{a^{2}+x^{2}}, \sqrt{a^{2}-x^{2}}, \sqrt{x^{2}-a^{2}}$, but it can be also used for integrals with $a^{2}+x^{2}, a^{2}-x^{2}, x^{2}-a^{2}$ or other variations.)

## Steps for Inverse Trig Substitution:

1. Look for the easy substitution or an inverse trig function you recognize.
2. Substitute for $x$ picking either Case 1,2 , or 3 (see above).
3. Rewrite integral in terms of $\theta$ and solve integral.
4. Substitute answer back in terms of $x$. Note sometimes you need to use trig identities and/or the triangle for this.

In this section, assume all domains are nice if not otherwise noted.

Example 8.2. Evaluate $\int_{1}^{2} \frac{1}{x^{2} \sqrt{x^{2}+4}} d x$

Example 8.3. Evaluate $\int \frac{1}{\sqrt{3-x^{2}}} d x \quad$ For $x \in(-\sqrt{3}, \sqrt{3})$.

Example 8.4. Evaluate $\int \sqrt{9-x^{2}} d x$ for $x \in(-3,3)$.

Example 8.5. Evaluate $\int \frac{1}{\sqrt{x^{2}+2 x-3}} d x \quad$ For $x \in(1, \infty)$.

### 8.2 ICE - Inverse Trig Substitution

2 sides!

1. Evaluate $\int \frac{1}{\left(x^{2}+1\right)^{\frac{3}{2}}} d x$.
2. Evaluate $\int \frac{1}{x^{2} \sqrt{5-x^{2}}} d x$ for $x \in(1,2)$.
3. Can we approach the integrals $I_{1}=\int \frac{x+1}{x^{2}+2 x+3} d x I_{2}=\int \frac{x+1}{x^{2}+4 x+3} d x$ and $I_{3}=$ $\int \frac{x+1}{x^{2}+4 x+5} d x$ using any of our methods of integration thus far? Explain.
4. Evaluate $\int \frac{x-2}{\sqrt{x^{2}+1}} d x$. Hint: Split the integral up into a sum. You should not need to use inverse trig substitution unless you want to.

## 9 Integration Using Partial Fractions

### 9.1 Partial Fractions

Today we will discuss a method of integration for rational equations in which substitution may not help us.
To start, how would we add $\frac{3}{x-2}+\frac{1}{x+4}=$

Now suppose we were asked to evaluate $\int \frac{4 x+10}{x^{2}+2 x-8} d x$

Suppose we were given $\frac{4 x+10}{x^{2}+2 x-8}$. How do we find two simple fractions
(called ___) whose sum is $\frac{4 x+10}{x^{2}+2 x-8}$

### 9.2 Partial Fractions Procedure:

Given $\int \frac{R(x)}{Q(x)} d x$ (and using simple substitution or algebra techniques won't work).
Step 1: Make sure the (degree of $R(x))<($ degree of $Q(x)$ ).
If it isn't, use polynomial division so that we can write the rational expression/partial fraction decomposition as $\frac{R(x)}{Q(x)}=S(x)+\frac{R^{\prime}(x)}{Q(x)}$ with $\operatorname{deg} R^{\prime}(x)<\operatorname{deg} Q(x)$. (This is like writing $\frac{10}{7}=1+\frac{3}{7}$ )

Step 2: Factor the denominator $Q(x)$ into linear factors and non-factorable quadratic factors (complex roots with determinant $b^{2}-4 a c<0$ ). See note at bottom of page.

Step 3: Form the partial fraction depending on the following cases:
Case 1: $Q(x)$ can be factored into a product of non-repeated linear factors e.g $Q(x)=(x-2)(x-3)(x)$.

The partial fraction decomposition is $\frac{R(x)}{Q(x)}=$
Case 2: $Q(x)$ can be factored into a product of linear factors, but at least one factor is repeated e.g: $Q(x)=(x-3)(x-2)^{3}$

The partial fraction decomposition is $\frac{R(x)}{Q(x)}=$
KEY: We have a partial fraction for each power of $(x-r)$ up \& including the $\mathrm{m}^{\text {th }}$ power!
Case 3:The factored form of $Q(x)$ has a non-repeated, non-factorable quadratic factor e.g $Q(x)=(x-3)\left(x^{2}+3\right)\left(x^{2}-x+1\right)$

The partial fraction decomposition is $\frac{R(x)}{Q(x)}=$
KEY: We have an $A_{i} x+B$ instead of an $A_{i}$ for the numerator of the quadratic factor.
Case 4: The factored form of $Q(x)$ has a repeated, non-factorable quadratic factor e.g $Q(x)=(x-3)\left(x^{2}+3\right)^{2}$

The partial fraction decomposition is $\frac{R(x)}{Q(x)}=$
KEY: This is a combination of Case 2 and Case 3.
Step 4: Clear denominators. (Multiply both sides by $Q(x)$ )
Step 5: Solve for coefficients (the A's, B's, C's, etc).
Note: This procedure is theoretically possible because every polynomial with real coefficients can be factored into linear factors and irreducible quadratic factors. Example: $x^{5}+3 x^{4}+4 x^{3}+12 x^{2}+4 x+12=(x+3)\left(x^{2}+2\right)^{2}$. This answers the question, "Why do we stop at Case 4 and not have irreducible cubics, quartics, etc?" Even though this factoring is theoretically possible, it isn't always easy to factor a polynomial. (It was shown in the 1800's that polynomials of degree 5 or higher cannot be solved, in general, by using only arithmetic and square roots).

Example 9.1. Evaluate $\int \frac{1}{x\left(x^{2}+1\right)} d x$

Example 9.2. Evaluate $\int \frac{2 x^{2}-7 x-24}{x^{2}-4 x-12} d x$

Example 9.3. Evaluate $\int \frac{d x}{e^{x}+e^{2 x}}$

### 9.3 ICE - Partial Fractions

1. Explain why the coefficients A and B cannot be found if we set $\frac{x^{2}}{(x-4)(x+5)}=\frac{A}{x-4}+\frac{B}{x+5}$
2. True or false: The "easiest way" to evaluate $\int \frac{6 x+1}{3 x^{2}+x} d x$ is with partial fractions.
3. Evaluate $\int \frac{x+1}{x\left(x^{2}+4\right)} d x$.
4. Evaluate $\int \frac{1}{x-\sqrt[3]{x}} d x$ Hint: Use the substitution $x=u^{3}$.

## 10 Approximating Integrals Using Numerical Methods

### 10.1 Approximating Integrals Review

We have been discussing sophisticated integration techniques. Unfortunately sometimes we have functions that aren't derivatives of a nice function. For example, the Gaussian function $f(x)=e^{-x^{2}}$ is not the derivative of any elementary function. That is, $\int e^{-x^{2}} d x$ does not exist! Other examples include the elliptical integral: $\int \sqrt{1-x^{4}} d x, \int \ln (\ln (x)) d x, \int \frac{e^{x}}{x} d x, \int e^{e^{x}} d x, \int \frac{1}{\ln x} d x, \int \frac{\sin x}{x} d x$, $\int \sin \left(x^{2}\right) d x$, and $\int \sqrt{x} \cos (x) d x$.
But we can approximate $\int_{a}^{b} e^{-x^{2}} d x$ for finite limits and also approximate the function using something called Taylor Polynomials (coming soon to a Calculus class you are in!)

Furthermore, the improper integral $\int_{-\infty}^{\infty} e^{-x^{2}} d x$ can be evaluated using multivariate calculus and polar coordinates and shown to equal $\sqrt{\pi}$. (You can look forward to this in Calculus III!!) We will talk about crazy improper integrals later on in Calculus II!

Recall, in Calculus I, we discussed how we could approximate the area under a curve using

$$
\int_{a}^{b} f(x) d x=\lim _{n \rightarrow \infty} \sum_{i=1}^{n} f\left(x_{i}\right) \Delta x_{i}
$$

We usually use end points of the subintervals to find the height of our rectangles. ${ }^{1}$ We also discussed how we could use just any point in the subintervals or the midpoints of subintervals.
When we use the left endpoint of our intervals to find the height of our rectangles, this is called a Left Riemann Sum.
When we use the right endpoint of our intervals to find the height of our rectangles, this is called a Right Riemann Sum.
When we use the midpoint of our intervals to find the height of our rectangles, this is called a Midpoint Approximation or the Midpoint Rule.

We are going to review the Midpoint Rule and introduce two other techniques.

[^1]
### 10.2 Midpoint Rule

## Procedure for Using Midpoint Rule:

1. Divide the interval $[a, b]$ into $n$ subintervals of equal width: $\Delta x=\frac{b-a}{n}$

Let $x_{0}=a<x_{1}<\ldots<x_{n}=b$ where $x_{i}=a+i * \Delta x$
2. Find corresponding y values. Let $y_{i}=$ $\qquad$ This gives the height of our rectangles.
3. Sum up the areas of the rectangles.

Example 10.1. Use the Midpoint Rules to approximate $\int_{1}^{5} x^{2} d x$ using 2 rectangles.

### 10.3 The Trapezoid Rule

## Procedure for Using Trapezoid Rule:

1. Divide the interval $[a, b]$ into $n$ subintervals of equal length: $h=\Delta x=\frac{b-a}{n}$ Let $x_{0}=a<x_{1}<\ldots<x_{n}=b$ where $x_{i}=a+i * \Delta x$
2. Find corresponding y values. Let $y_{i}=f\left(x_{i}\right)$ This gives the bases of our trapezoids.
3. Sum up the areas of the trapezoids.

## Trapezoid Rule:

$\int_{a}^{b} f(x) d x \approx \Delta x\left[\frac{1}{2} f\left(x_{0}\right)+f\left(x_{1}\right)+f\left(x_{2}\right)+\ldots f\left(x_{n-1}\right)+\frac{1}{2} f\left(x_{n}\right)\right]$
or $\approx \frac{\Delta x}{2}\left[f\left(x_{0}\right)+2 f\left(x_{1}\right)+2 f\left(x_{2}\right)+\ldots 2 f\left(x_{n-1}\right)+f\left(x_{n}\right)\right]$
where $h=\Delta x=\frac{b-a}{n}$
Example 10.2. Use the Trapezoid rule to approximate $\int_{0}^{8} x e^{x} d x$ using 4 trapezoids.

### 10.4 Simpson's Rule

Now we will use parabolas instead of trapezoids or rectangles. (Woo!)

The area under the parabola determined by $\left(x_{0}, y_{0}\right),\left(x_{1}, y_{1}\right)$, and $\left(x_{2}, y_{2}\right)$ is

## Procedure for Using Simpson's Rule:

1. Divide the interval $[a, b]$ into $n$ subintervals of equal length. n MUST be EVEN!:

$$
\Delta x=\frac{b-a}{n} \text { Let } x_{0}=a<x_{1}<\ldots<x_{n}=b \text { where } x_{i}=a+i * \Delta x
$$

2. Find corresponding y values. Let $y_{i}=f\left(x_{i}\right)$ This gives points of the parabolas.
3. Sum up the areas of the parabolas.

Simpson's Rule:
$\int_{a}^{b} f(x) d x \approx \frac{\Delta x}{3}\left[f\left(x_{0}\right)+4 f\left(x_{1}\right)+2 f\left(x_{2}\right)+4 f\left(x_{3}\right)+2 f\left(x_{4}\right) \ldots 4 f\left(x_{n-1}\right)+f\left(x_{n}\right)\right]$
where $\Delta x=\frac{b-a}{n}$ and n is even.
Simpson's rule is related to the Trapezoid and Midpoint Rule:

Example 10.3. Use Simpson's rule to approximate $\int_{0}^{8} x e^{x} d x$ using $n=4$.

### 10.5 Approximating Error in Numerical Methods

The error in an approximation is the amount that needs to be added to the approximation to make it exact.

The error in the Midpoint Rule is $E_{M}=\left|\int_{a}^{b} f(x) d x-M_{n}\right|$
The error in the Trapezoid Rule is $E_{T}=\left|\int_{a}^{b} f(x) d x-T_{n}\right|$
The error in Simpson's Rule is $E_{S}=\left|\int_{a}^{b} f(x) d x-S_{n}\right|$
Error Bounds: Suppose $\left|f^{\prime \prime}(x)\right| \leq K$ for $a \leq x \leq b$.
Then $\left|E_{M}\right|<\frac{K(b-a)^{3}}{24 n^{2}}$ and $\left|E_{T}\right|<\frac{K(b-a)^{3}}{12 n^{2}}$
Suppose $\left|f^{(4)}(x)\right| \leq K$ for $a \leq x \leq b$. Then $\left|E_{S}\right|<\frac{K(b-a)^{5}}{180 n^{4}}$

Example 10.4. Find the maximum error in using $S_{6}$ to calculate $\int_{1}^{3} \cos (2 x) d x$.

Example 10.5. a) Find the maximum error in our trapezoid approximation, $T_{4}$ for $\int_{0}^{8} x e^{x} d x$
b) How large should we take $n$ to be in order to guarantee that our trapezoid approximation is within 0.1?

### 10.6 ICE - Numerical Approximation

Recall there is no elementary indefinite integral for the Gaussian function $f(x)=e^{-x^{2}}$. This function shows up in many applications including statistics and quantum mechanics. Let's use numerical methods to approximate the Gaussian Function over the interval $[1,13]$

Given $\int_{1}^{13} e^{-x^{2}} d x$
a) Set up the sums to find $T_{4}$ and $S_{4}$

Turn over!
b) How large do we have to choose $n$ so that $T_{n}$ is accurate to within 0.001 ?

## 11 Strategy for Integration

So many integration techniques! How do we choose?!?!
Actually, it seems like we have a lot of choices, but most are just variations of $\qquad$ -
My best suggestion for gaining intuition about integration strategy is

## Gameplan for integration:

1. Do I recognize the integrand as a function I know the antiderivative for? Check for derivatives of $\arctan x, \arcsin x, \operatorname{arctanh} x$ etc.
2. Can I use a basic substitution? Often you can set w as an "inside" function or the whole denominator (so our integral looks like $\frac{1}{w}$ ). Be on the lookout for "inside" functions that have derivatives hanging out in the integrand or if you have a linear expression (constant derivative -yay!) inside another function(eg if you have $\sqrt[n]{a x+b}$ ). And remember you can set w as a sum of terms.
3. Can I simplify the integrand to make my life easier? (Expand a binomial, find a common denominator, use polynomial division, rewrite in terms of $\sin x, \cos x$ ?)
4. Are there only higher powers of trig functions? If so, use higher trig substitution and/or trig identities.
5. Do I see a version of this expression $\sqrt{x^{2}+a^{2}}, \sqrt{x^{2}-a^{2}}, \sqrt{a^{2}-x^{2}}$ ? Use Inverse Trig substitution You may need to Complete the Square!
6. Do I have integrand that is a rational expression? Then I may be able to use partial fractions.
7. Can I use integration by parts? Often you will see a product of functions or a "loner" like $\ln x, \arctan x$, etc. If you have a product, one function will be something you cannot integrate right away but can differentiate, and the other is a function you can integrate.
8. Remember often you must use more than one method. (Usually one of these methods is substitution)

Still stuck? Then try again using a different method. Most of the time you need a creative substitution as a primary step before seeing a suitable method. Or you need to try integration by parts. Go back and see if completing a square will help you. Also beaware of "cycling integrals!"

Last ditch effort: Think back and try to relate the integral to another integral you may have done in class, homework, or ICE. This is where practice really really helps!

Example 11.1. For each integral, suggest one approach that you think is appropriate to evaluate the integral.
a) $\int \frac{x^{2}-x}{2 x^{3}-3 x^{2}+2} d x$
b) $\int \frac{d x}{\sqrt{4 x^{2}+1}}$
c) $\int \frac{2 x^{2}}{x^{2}-2 x+8} d x$
d) $\int \frac{x}{\sqrt{1-x^{2}}} d x$
e) $\int \sin ^{3} x \cos ^{5} x d x$
f) $\int \frac{1}{4 x^{2}-9} d x$
g) $\int x \csc x \cot x d x$
h) $\int 3^{x} \cos (2 x) d x$
i) $\int \arcsin x d x$
j) $\int \frac{1}{\sqrt{1-x^{2}} \arcsin x} d x$
k) $\int \tan ^{3} x \sec ^{5} x d x$
l) $\int \frac{3 x-1}{x+2} d x$

Interesting Substitutions:
m) $\int \frac{\ln x}{x \sqrt{1+(\ln x)^{2}}} d x$
n) $\int \frac{1}{1+e^{x}} d x$

### 11.1 Interesting Examples

Example 11.2. Evaluate $\int e^{x+e^{x}} d x$

Example 11.3. Evaluate $\int(1+\sqrt[3]{x})^{4} d x$ (Neat Substitution Technique!)

Example 11.4. Evaluate $\int \frac{\arctan x}{x^{2}} d x$

Example 11.5. Evaluate $\int \frac{\sec (x) \tan (x)}{\sec ^{2}(x)-\sec (x)} d x$

### 11.2 ICE - Review of Integral Techniques

1. I have $\sin ^{n} x$, or $\sin ^{n} x \cos ^{m} x$, and n is odd like $\int \sin ^{3} x \cos ^{4} x d x$. What do I do?
2. I have $\cos ^{m} x$, or $\sin ^{n} x \cos ^{m} x$ like $\int \sin ^{4} x \cos ^{3} x d x$, and m is odd. What do I do?
3. I have $\sin ^{n} x, \cos ^{m} x$, or $\sin ^{n} x \cos ^{m} x$, but only even powers like $\int \sin ^{2} x \cos ^{2} x d x$. What do I do?
4. I have $\tan ^{n} x \sec ^{m} x$, with at least 1 value of each and n is odd like $\int \tan ^{3} x \sec ^{3} x d x$. What do I do?
5. I have $\tan ^{n} x \sec ^{m} x$, with at least 1 value of each and $m$ is even like $\int \sec ^{4} x \tan ^{2} x d x$. What do I do?
6. I have $\tan ^{2} x$ without any even powers of $\sec x$ or $\cot ^{2} x$ without any even powers of $\csc x$ like $\int \tan ^{2} x d x$. What do I do?
7. I have a bunch of $e^{x}, a^{x}$, or $e^{n x}$ (usually where normally I would have x and $x^{n}$ s) like $\int \frac{1}{e^{x}+e^{2 x}} d x$. What can I do?
8. I have a product of two or more functions like like $\int x \sin x d x$ or $\int x \ln x d x$. What can I do?
9. I have a product, one factor is a value of $x$ and the other is a function I can't integrate right away like $\int x \arcsin x d x$. What can I do?
10. I have a product, I can integrate one part of product (usually powers of trig functions), but the problem is there is an $x$ term which makes my life a bit difficult like $\int x \tan ^{2} \sec ^{2} x d x$ What can I do?
11. I have a version of square root $\sqrt{x^{2}+a^{2}}, \sqrt{x^{2}-a^{2}}, \sqrt{a^{2}-x^{2}}$. First I look for a version of Or what can I do?
12. I have a version of square root $\sqrt{x^{2} \pm b x+a^{2}}, \sqrt{x^{2} \pm b x-a^{2}}, \sqrt{a^{2} \pm b x-x^{2}}$. What can I do?
13. I have integrand that is a rational expression like $\int \frac{x+2}{x 2-5 x+6} d x$. What can I do? (sometimes there are 2 approaches)
14. I have a linear "inside" function like $\sqrt[n]{a x+b})$ like $\int \sqrt{3 x+5} d x$. What can I do?
15. I have a term like $\int(1+\cos (2 x))^{2} d x$ or $\int\left(1+w^{3}+6 w\right)\left(w^{3}\right) d x$. What can I do?
16. I have a fraction with trig functions like $\int \frac{\tan x}{\sec x} d x$ or $\int \frac{\sin x}{\cos ^{2} x} d x$. What can I do?
17. I have a function with a sum in the numerator like $\int \frac{x+5}{\sqrt{1-x^{2}}} d x$ or $\int \frac{x^{2}+6}{\sqrt{x^{2}+a^{2}}} d x$ What could I do?
18. I have only 1 function and I don't know how to integrate it like $\int \arctan x$. What can I do?

## 12 Volumes of Rotations

### 12.1 Disk Method

We are able to find the area between curves. In this section, we learn how to calculate volume of solids we make by rotating these areas around lines. First let's review... What is the volume of a cylinder?

The "typical element" is a $\qquad$ of radius ___ and height $\qquad$ So the volume is $\qquad$ .

We can find the volume of the solid by $V=$
This method is called the Disk Method because the "typical element" we use a solid disk. It may be better to memorize the general idea of the Disk Method:

1. Draw a typical element.
2. Write the volume of a typical element.
3. Find bounds (the limits of integration).
4. Write and solve integral.

Example 1: Set up an integral that finds the volume of the region bounded by $y=1-(x-2)^{2}$ and $y=0$ rotated around the $x$-axis

### 12.2 Washer Method

What if the region is bounded by 2 curves?

The volume of a "typical element" is

We can find the volume of the solid by $V=$
This method is called the Washer Method because the "typical element" we use a washer.
Key Point: The variables and limits are determined by the typical element, NOT where the rotation is!!!

Example 2: Set up the integral used to find the volume of rotating the region bounded by $y=5$ and $y=x^{2}+1$ rotated around the x -axis.

Example 3: a) Set up the integral used to find the volume of the region bounded by $y=1-(x-2)^{2}$ and $y=0$ rotated around $y=-1$.
b) Now find the volume of the same region rotated around $y=3$.

Example 4: a) Set up the integral used to find the volume of the region bounded by $y=x^{\frac{3}{4}}$, $x=16, y=0$ rotated around the $y$ axis.
b) Now find the volume of the same region rotated around $x=-1$.

## Notes:

- Notice that when we use $d y$, the functions in the integrand are functions of $\mathbf{y}(x=x(y))$.
- When using functions of $y$, we subtract: the right curve - left curve to find the correct (positive) "height" of our "typical element." This is analogous when we subtract: the top curve - bottom curve for functions of $x$.
- Think about which direction is positive on the axis; associate + with "up" / "top."

### 12.3 Cylindrical Shells Method

In this section, we learn another method to calculate the volume of solids we make by rotating these areas around lines. Consider the volume of $f(x)$ rotated around the y -axis.

The "typical element" is a $\qquad$ or ring of radius $\qquad$ Imagine cutting the ring somewhere and "unrolling" it to form a rectangular prism.

We can find the volume of the solid by $V=$
What if the region is bounded by 2 curves?

The volume of a "typical element" is

We can find the volume of the solid by $V=$
This method is called the Shell Method because the "typical element" we use is a solid shell.
Notice the typical element using the Shell Method is parallel to the axis of rotation! And the typical element using the Disk/Washer Method is Perpendicular to the axis of rotation!

Recall General Idea of Any Volume Method:

1) Draw a typical element.
2) Write the volume of a typical element.
3) Find bounds (the limits of integration).
4) Write and solve integral.

Example 5: a) Use the shell method to find the volume of the region bounded by $y=1-(x-2)^{2}$ and $y=0$ rotated around the $y$-axis.
b) Now find the same volume using the washer method.

Example 6: a) Use the shell method to find the volume of the region bounded by $y=x^{2}, y=x$, rotated around the $x=-1$.
b) Now find the volume for the same region rotated around $x=5$.

Example 7: Consider the region bounded by $y=\sqrt{x}$ and $x=4$, and the $x$-axis.
a) Use both methods to set up the integral to find the volume of rotating the region around the x -axis.
b) Use both methods to set up the integral to find the volume of rotating the region around the y-axis.

Example 8: Identify the axis of rotation for the following volumes (you can compute them later for practice, if you like).
a) $\int_{0}^{2} \pi\left((4 y)^{2}-\left(y^{3}\right)^{2}\right) d y$
b) $\int_{0}^{2}\left(2 \pi x \cdot x^{3}\right) d x$
c) $\int_{0}^{1} 2 \pi(2-x)\left(x-x^{2}\right) d x$
d) $\int_{0}^{1} \pi\left((2+y)^{2}-\left(2+y^{2}\right)^{2}\right) d y$

### 12.4 ICE - Volumes

For the following questions, find the equation for the volume of the solid formed by the region bounded by $x=y^{2}$ and $x=2 y$ rotated around the following lines. DO NOT EVALUATE THE INTEGRALS!!! Just set them up.

1. Use the Disk/washer method to set up the integral of the region rotated around the $y$-axis.
2. Use the Shell method to set up the integral of the region rotated around the $y$-axis.
3. Use the Disk/washer method to set up the integral of the region rotated around the $x$-axis.
4. Use the Shell method to set up the integral of the region rotated around the $x$-axis.
5. Use the Disk/washer method to set up the integral of the region rotated around $x=-1$.
6. Use the Shell method to set up the integral of the region rotated around $x=-1$.
7. Use the Disk/washer method to set up the integral of the region rotated around $y=-1$.
8. Use the Shell method to set up the integral of the region rotated around $y=5$.
9. Use the Shell method to set up the integral of the region rotated around $y=-1$.
10. Use the Disk/washer method to set up the integral of the region rotated around $y=5$.
11. Use the Shell method to set up the integral of the region rotated around $x=5$.
12. Use the Disk/washer method to set up the integral of the region rotated around $x=5$.
13. Set up the integral for the region bounded by $y=-x^{2}+3 x-2=-(x-2)(x-1)$ and $y=0$ rotated around the $y$-axis.
14. Use the Disk/Washer Method to set up the integral for the region bounded by $x=-y^{2}-2$, $x=y^{2}-1, y=-1, y=1$ rotated around the $y$-axis.
15. Use the Shell Method to set up the integral for the region bounded by $f(x)=-x^{2}+2 x=$ $-x(x-2)$ and $g(x)=x^{2}-2 x=x(x-2)$ rotated around the $y$-axis.

## 13 Arc Length

It is easy to calculate distance when someone is traveling in a straight line:

But often this is not the case. So it is helpful to know how to calculate the length of a curve. We will just give an idea of the derivation for the Arc Length Formula. See your text for details.

Mean Value Theorem: If f is continuous on $[a, b]$,
then there is a $c$ in $(a, b)$ such that $f^{\prime}(c)=\frac{f(b)-f(a)}{b-a}$.

## Arc Length Formula:

If $f^{\prime}$ is $\qquad$ on $[\mathrm{a}, \mathrm{b}]$, then the length of the curve $y=f(x)$ over $[\mathrm{a}, \mathrm{b}]$ is $\mathrm{L}=$

Example 13.1. Find the arc length of $y=3 \ln x-\frac{x^{2}}{24}$ over $1 \leq x \leq 6$.

Remember sometimes when we were finding the area under a curve, it was helpful not to integrate with respect to x , but instead with respect to $\qquad$ We have a similar situation here.

Arc Length for the curve $x=g(y)\left(g^{\prime}\right.$ continuous) over $x \in(a, b)$ and $y \in(c, d)$ is

Arc Length Function:By the Fundamental Theorem of Calculus, we can generalize the length of a curve so that we a function that represents the length of a curve.
For a curve with initial point $(a, f(a))$, The arc length function is $s(x)=\int_{a}^{x} \sqrt{1+\left[f^{\prime}(t)\right]^{2}} d t$

Example 13.2. Set up an integral to find the length of the curve of $x=\sqrt{1-y^{2}}$ for $\frac{-1}{2} \leq y \leq \frac{1}{2}$.

Example 13.3. Find the length of the curve $y=x^{\frac{2}{3}}$ between $x=0$ and $x=8$.

### 13.1 ICE - Arc Length

Suppose we want to find the length of the curve $y=f(x)=\ln \left(x+\sqrt{x^{2}-1}\right)$ on the interval $[1, \sqrt{2}]$ [Notice this function is $f(x)=\operatorname{arccosh} x$.] Hint: USE THIS FACT for parts a and c.
a) Calculate $f^{\prime}(x)$. What problem do we have?
b) How can we deal with this problem?
c) Find $f^{-1}(x)$ and use it to write our function in the form $x=g(y)$. Hint: There is a quick way to do this and a long way.
d) Use $x=g(y)$ to calculate the arc length.

## 14 Surface Area

### 14.1 Deriving Surface Area of a Revolution

Earlier, we learned how to calculate the volume of solids we make by rotating these areas around lines. Now we are going to learn how to calculate the $\qquad$ of these solids. First let's recall the how to find the area of a circular sector

Thus the lateral surface area of our cone is What about a more complicated example? Say perhaps a section of the circular cone. Which makes us have more of an Abu the Monkey's hat instead of a dunce's hat.

### 14.2 Surface Area of a Revolution about x-axis

The "typical element" is a section of a _ with slant length $=$ and the radius is

Thus the surface area of our typical element is

Important: When rotating around the $\mathbf{x}$-axis we will always have: $2 \pi$ $\qquad$ or $2 \pi$ $\qquad$ BUT, when finding our length (arc length) we can do this either with respect to x or y .

## Surface Area when rotating about x-axis:

Integrating with respect to $x$ : The surface area obtained by rotating the curve $y=f(x)$ over $a \leq x \leq b$ about the $x$-axis is $\mathrm{S}=$

Integrating with respect to $y$ : The surface area obtained by rotating the curve $x=g(y)$ over $c \leq y \leq d$ about the $x$-axis is $\mathrm{S}=$

Example 14.1. Setup an integral representing the surface area obtained by rotating $x=\frac{y^{2}}{9}+2$ about the $x$-axis for $3 \leq x \leq 6$.

Example 14.2. Set up an integral representing the surface area obtained by rotating $x=\frac{y^{2}}{9}+2$ about the $x$-axis for $3 \leq x \leq 6$ but integrate with respect to $x$.

### 14.3 Surface Area of a Revolution about y-axis

The "typical element" is a section of a
and the radius is

Thus the surface area of our typical element is

Important: When rotating around the $\mathbf{y}$-axis we will always have: $2 \pi$ $\qquad$ or $2 \pi$
BUT as before, when finding our length (arc length) we can do this either with respect to x or y .

## Surface Area when rotating about y-axis:

Integrating with respect to $x$ : The surface area obtained by rotating the curve $y=f(x)$ over $a \leq x \leq b$ about the $y$-axis is $\mathrm{S}=$

Integrating with respect to $y$ : The surface area obtained by rotating the curve $x=g(y)$ over $c \leq y \leq d$ about the $y$-axis is $\mathrm{S}=$

Example 14.3. Set up an integral that finds the surface area obtained by rotating $x=\sqrt{y-1}$ about the $y$-axis for $1 \leq y \leq 2$

Example 14.4. Find the surface area obtained by rotating $y=1+x^{2}$ about the $y$-axis for $2 \leq x \leq 3$, and integrate with respect to $y$.

## Guidelines for finding Surface Area from a curve rotated about either axis:

1. Sketch the general idea of the curve.
2. Determine if we have $2 \pi x$ (or $2 \pi g(y)$ ) or $2 \pi y$ (or $2 \pi f(x)$ ).
3. Decide which variable you want to integrate with respect to and take the corresponding version of the arc length formula $\sqrt{1+\left(f^{\prime}(x)\right)^{2}}$ or $\sqrt{1+\left(g^{\prime}(y)\right)^{2}}$
4. Rewrite $2 \pi x$ in terms of y if you are integrating with respect to y . And rewrite $2 \pi y$ in terms of x if you are integrating with respect to x .
5. Make sure you have to correct limits of integrating.
6. Calculate the integral.

### 14.4 ICE - Surface Area

1. Set up an integral representing the surface area obtained by rotating $y=1+e^{x}$ about the $x$-axis for $0 \leq x \leq 1$
2. Set up an integral representing the surface area obtained by rotating $y=1+e^{x}$ about the $x$-axis for $0 \leq x \leq 1$ but integrate with respect to $y$.
3. Set up an integral representing the surface area obtained by rotating $y=1+e^{x}$ about the $y$-axis for $0 \leq x \leq 1$
4. Set up an integral representing the surface area obtained by rotating $y=1+e^{x}$ about the $y$-axis for $0 \leq x \leq 1$ but integrate with respect to $y$.
5. Set up an integral representing the surface area obtained by rotating the region bounded by $y=1+e^{x}$ and $y=\sqrt{x}$ for $0 \leq x \leq 1$ about the line $y=-1$
6. Set up an integral representing the surface area obtained by rotating the region bounded by $y=1+e^{x}$ and $y=\sqrt{x}$ for $0 \leq x \leq 1$ about the line $y=-1$ integrating with respect to y .

## 15 Using Integrals to Calculate Work and Hydrostatic Force

### 15.1 Work with constant Force

When we say something is work, usually we mean the total amount of effort we need to put forth to complete a task. In physics it has a more technical meaning that depends on the idea of $\qquad$ . What is a force? We often think of it as a stress on an object, a $\qquad$ or $\qquad$ on an object.
Example: Newton's Second Law of Motion:

Note: We will assume the acceleration due to gravity is $g=9.8 \mathrm{~m} / \mathrm{s}^{2}$
If we have constant mass and acceleration, the force F is also a constant and the work done is defined to be :

Force $\mathrm{F}=\quad$ and Density $\rho=\quad$ so Mass $m=$
Units:

Metric:
Mass is measured in kilograms ( kg )
Displacement is measured in meters (m)
Time is measured in seconds (s)
Force is measured in Newtons (N)
Work is measured in Joules (J)

US:
Mass is measured in pounds (lbs)
Displacement is measured in feet (ft)
Time is measure in seconds (s)
Force is measured in pounds (lbs)
Work is measured in foot-pounds (ft-lbs)

Example 15.1. How much work does Harriet do when she lifts a 20 kg dumbbell a height of 3 meters?

Example 15.2. How much work does Barry do when he lifts a 30 lb weight 7ft off the ground?

### 15.2 Work with varying Force

So we can determine the work done when we have a constant force (see examples 1-2). But what do we do when the force is varying?

Suppose I have an object moving along the x -axis and I have a varying force. So I can write my force as a function of x , say, $\qquad$

Common Idea: Notice regardless if we are calculating area, volume, surface area, or work, we slice small enough so that we can convert the problem to its simplest form and calculate the area/volume/surface area/work of the typical slice. If we slice small enough in this example, we can treat the force as a constant and find the work on a typical slice and then add up all the parts.

Definition: The work done in moving an object from $a$ to $b$ of a force $f(x)$ is $W=$ $\qquad$ Sometimes we are given the force function, but often we have to create the force function.

Example 15.3. Suppose an object is located a distance $x$ feet from the origin has a force of $x^{3}+1$ acting on it. How much work is done in moving it from $x=1$ to $x=2 \mathrm{ft}$.

Hooke's Law: The force required to maintain a spring stretched x units beyond its natural length is proportional to x :

Note: $k$ is a $\qquad$ constant which includes $g$ called the $\qquad$ constant \& we assume $x$ is not

Example 15.4. A spring has a natural length of 20 cm . If a $25-\mathrm{N}$ force is required to keep it stretched to a length of 30 cm . How much work is required to stretch it from 20 cm to 24 cm ? [Careful of units!]

Note: Hooke's Law is nice because it gives us the general form for the varying force. In the next problems, we have to find the force function.

Example 15.5. a) A 800 lb box of baby chinchillas is at the bottom of a 500 ft pit. Luckily you were able to attach a rope that weighs $2 \mathrm{lb} / \mathrm{ft}$ to the top of the box. How much work will you have to do to save the baby chinchillas (bring them to the top)?
b) Notice that our first step was to draw a picture and set up a coordinate system (set $x=0$ somewhere). Sometimes other professors/Webassign will use a different convention than Dr. Harsy. So let's use a different coordinate system for this.

Example 15.6. a) Suppose a tank has a shape of triangular prism with a height of 4 ft and length of 6 ft and a width of 2 ft with a 1 foot spout. Suppose it is completely filled with water. Set up an integral to represent the work required to empty the tank by pumping all the water out of the spout. Use the fact that the weight of water is $62.5 \mathrm{lb} / \mathrm{ft}^{3}$.

b) Answer the same question as part a. Only now suppose the tank is only filled up to a height of 3 ft .

### 15.3 Hydrostatic Force

We can also use methods similar to calculating work to calculate the force we feel due to water pressure.

Remember Force $\mathrm{F}=\quad$ and Density $\rho=\quad$ so Mass $m=\quad \& \mathrm{~V}=$
When we swim under water, the water above us has a force on us. We feel "pressure" we define pressure $P=$

That is Pressure $=$ $\qquad$ $\times$ $\qquad$ $\times$ $\qquad$
Our units for pressure are $\mathrm{N} / \mathrm{m}^{2}$ or a Pascal. Sometimes we use kPa (kilopascal).
Fact 1: The density of water is $\rho=1,000 \mathrm{~kg} / \mathrm{m}^{3}$ or $62.5 \mathrm{lb} / \mathrm{ft}^{3}$
Fact 2: The pressure at any point in a liquid is the same in all directions.
Fact 3: The pressure in any direction at a depth d in a fluid with density $\rho$ is $P=$ $\qquad$
Fact 4: If we have a constant pressure P acting on a surface with area A . Then the hydrostatic force that acts on the area is $F=$

Careful, if the pressure varies with the depth, then we have to set up an integral resulting from taking the limit of a Riemann Sum of the Force at each depth.

Example 15.7. A tank is 4 meters wide, 5 meters long, 3 meters high and contains a liquid with density $800 \mathrm{~kg} / \mathrm{m}^{3}$ to a depth of 2 meters.
a) Find the hydrostatic force on the bottom of the tank.
b) Set up an integral to find the hydrostatic force on one end of the tank.

Example 15.8. a) Set up an integral that expresses the hydrostatic force against one side of the vertical plate that is submerged in water with the shape indicated by the picture below.

b) Now suppose the same plate is floating 1 ft above the water. Set up an integral that calculates the hydrostatic force for this situation.

### 15.4 ICE - Work and Hydrostatic Force

1. Set up an integral that expresses the hydrostatic force against one side of the vertical plate that is submerged in water with the shapes indicated by the pictures below.

a)

b)
2. Suppose a tank has a shape of a sphere with a radius of 3 ft with a 1 foot spout. Suppose it is completely filled with water. Set up the integral used to find the work required to empty the tank by pumping all the water out of the spout. Use the fact that the weight of water is $62.5 \mathrm{lb} / \mathrm{ft}^{3}$. Hint: Set $x=0$ at the diameter.

3. A chain lying on the ground is 10 m long and its mass is 80 kg . Set up the integral to determine how much work is required to raise one end of the chain to a height of 6 meters? Use $g=9.8 \mathrm{~m} / \mathrm{s}^{2}$.
4. A trough is filled with a liquid of density $800 \mathrm{kh} / \mathrm{m}^{3}$. The ends of the trough are equilateral triangles with sides 8 m long and vertex at the bottom. Set up an integral to determine the hydrostatic force on one end of the trough. [Hint the height of an equilateral triangle with side length 8 is $4 \sqrt{3}]$.

## 16 Improper Integrals

### 16.1 Calculating Improper Integrals

When we consider definite integrals $\int_{a}^{b} f(x) d x$, we assume that $a$ and $b$ are finite AND $f(x)$ is bounded. Consider the region bounded by $x=1, y=\frac{1}{x^{2}}$ and $y=0$.

We can write the area (formally) as
This is only symbolic since we don't have a definition of the integral with infinite limits of integration.
Solution: $\int_{a}^{\infty} f(x) d x:=$

Now we can solve the question above:

Note: If we have $\int_{-\infty}^{\infty} f(x) d x$

Example 16.1. Determine $\int_{2}^{\infty} \frac{1}{x} d x$

Example 16.2. Find the area of the region bounded by $y=\frac{1}{\sqrt[3]{x}}, y=0, x=0, x=1$.

Example 16.3. Determine $\int_{0}^{2} \frac{2}{(x-1)^{3}} d x$

Example 16.4. Is $\int_{2}^{3} \frac{2}{(x-1)^{3}} d x$ an improper integral?

### 16.2 Comparison Tests for Improper Integrals

Sometimes even if we cannot find the exact value for an improper integral, we can determine whether the integral diverges or converges by comparing it to a known integral. This idea will come in handy later when we learn about sequences and series!

## Direct Comparison Theorem:

Suppose $f$ and $g$ are ___ functions with $0 \leq g(x) \leq f(x)$ for $x \geq a$, then

1) If $\int_{a}^{\infty} f(x) d x$ is convergent, then $\int_{a}^{\infty} g(x) d x$
2) If $\int_{a}^{\infty} g(x) d x$ is divergent, then $\int_{a}^{\infty} f(x) d x$

Note: If $\int_{a}^{\infty} f(x) d x$ is divergent or $\int_{a}^{\infty} g(x) d x$ is convergent, then we know $\qquad$

How to choose comparison functions:
$f(x)=\frac{x^{3}+x+1}{x^{4}-x^{2}-1}$ compare with $g(x)=$

Example 16.5. Is $\int_{2}^{\infty} \frac{x^{3}+x+1}{x^{4}-x^{2}-1} d x$ convergent or divergent?

Example 16.6. Show that $\int_{1}^{\infty} \frac{\left(\sin ^{2} x\right)}{x^{2}} d x$ is convergent.

Example 16.7. Show that $\int_{1}^{\infty} \frac{x}{x^{3}-x-1} d x$ is convergent. What is the problem with using $a$ direct comparison?

The Limit Comparison Theorem: Suppose $f$ and $g$ are positive functions on $[a, \infty)$ and we know whether or not $\int_{a}^{\infty} g(x) d x$ converges or diverges. Let $\lim _{x \rightarrow \infty} \frac{f(x)}{g(x)}=L$, then

1) If L is finite $(0<L<\infty)$ then $\int_{a}^{\infty} g(x) d x$ and $\int_{a}^{\infty} f(x) d x$ either BOTH $\qquad$ or BOTH $\qquad$
2) If $\mathrm{L}=0 \mathrm{AND} \int_{a}^{\infty} g(x) d x$ $\qquad$ then $\int_{a}^{\infty} f(x) d x$ $\qquad$
3) If $L=\infty$ AND $\int_{a}^{\infty} g(x) d x$ $\qquad$ then $\int_{a}^{\infty} f(x) d x$ $\qquad$
Now use the LCT to finish Example 16.7.

### 16.3 ICE - Improper Integrals

1. Use the Comparison Theorem to determine whether the following integrals converge or diverge. That is find a comparison function, calculate its improper integral over the same integral, and then apply either the Direct Comparison Theorem or the Limit Comparison Theorem.
a) $\int_{0}^{\pi} \frac{\sin ^{2} x}{\sqrt{x}} d x$
b) $\int_{4}^{\infty} \frac{1}{\sqrt{x}-1} d x$
c) $\int_{4}^{\infty} \frac{x^{3}+x^{2}+1}{x^{4}+2} d x$
d) $\int_{1}^{\infty} \frac{2+e^{-x}}{x+1} d x$
2. Evaluate the improper integral $\int_{2}^{5} \frac{1}{x-2} d x$ or show that it diverges.

## 17 Review

### 17.1 ICE -Gabriel's Horn

Consider the object (called Gabriel's Horn) created by rotating the curve $f(x)=\frac{1}{x}$ for $x \geq 1$ about the x -axis.

1. Sketch the graph and think about why this object (made after rotation) is called Gabriel's Horn.

2. Find the volume of Gabriel's Horn using the disk method.
3. Set up an integral to represent the surface area of Gabriel's Horn.
4. Compare this improper integral to another function to show that this integral diverges. Note: You can evaluate the integral. Let $w=\frac{1}{x}$. Then use inverse substitution and then you get an integral with $\sec ^{2} \theta \csc \theta$ so you have to simplify using $\sec ^{2} \theta=1+\tan ^{2} \theta$. Then split the integral and integrate (remembering to substitute back twice.)

## 18 Sequences

### 18.1 Introduction to Sequences

A sequence is a list (usually of numbers) that has a particular order assigned to each term (member) of the list $\{2,4,6,8,10, \ldots\}$. Often we represent sequences as $\left\langle a_{n}>, a_{n}, a_{n_{n=k}^{\infty}}^{\infty}\right.$ or $\left\{a_{1}, a_{2}, a_{3}, \ldots\right\}$. We call $n$ the $\qquad$ and it just tells us where the term is ordered in the list. Usually, but not always, n starts at 0 or 1 .

We can represent our sequences in several different ways. Given $\{2,4,6,8,10, \ldots\}$, we can write this as more of a formula: $a_{n}=$

We can also write this sequences in an implicit formula (or recursive relation): $a_{1}=2, a_{n}=$

Often writing a sequence in an explicit formula is the most useful way: $a_{n}=$

Example 18.1. Find an explicit formula for the following sequence, $\left\{\frac{2}{3}, \frac{4}{4}, \frac{6}{5}, \frac{8}{6}, \frac{10}{7}, \ldots\right\}$

Example 18.2. Find an explicit formula for the following sequence, $\left\{\frac{1}{2}, \frac{-1}{4}, \frac{1}{6}, \frac{-1}{8}, \frac{1}{10}, \ldots\right\}$

Some sequences cannot be written in an explicit way or are very difficult to do so.

Example 18.3. Find an implicit formula for the following sequence, $\{1,1,2,3,5,8,13, \ldots\}$.

Image from: Amend, B. "FoxTrot.com." Cartoon from Oct. 11, 2005. http://www.foxtrot.com
Note: There actually is a closed form for the Fibonacci Sequence: $F_{n}=\frac{(1+\sqrt{5})^{n}-(1-\sqrt{5})^{n}}{2^{n} \sqrt{5}}$
Example 18.4. Find an explicit or implicit formula for $a_{n}=\{-1,1,-1,1,-1, \ldots\}$.

Example 18.5. Find an explicit or implicit formula for $a_{n}=\{2,3,5,7,11,13,17, \ldots\}$.

### 18.2 Limits of Sequences

We define limits of sequences in the same spirit as limits of functions.
Definition of a limit:
The limit of a sequence $<a_{n}>$ is $L$ if as n increases, $a_{n}$ gets closer to $\qquad$ .
That is, $\lim _{n \rightarrow \infty} a_{n}=L$. Note $L$ needs to be finite.
And we say that the limit of $a_{n}$ as $n$ approaches $\infty$ is $L$.
If a sequence has a limit we say it is a $\qquad$ sequence. Otherwise we say the sequence is
$\qquad$ or that the limit does not exist, or the sequence diverges to $\pm \infty$.

Example 18.6. Which of our sequence examples so far have limits?

Definition of a Sequence with an Infinite limit:
Give a sequence $\left\langle a_{n}\right\rangle, \lim _{n \rightarrow \infty} a_{n}=\infty$ means for any $M>0$, we can find an integer N such that if $n>N$, then $\qquad$ -.

Example 18.7. Give an example of a sequence that diverges to $\infty$.

Definition for the Nonexistence of a Limit: We say $\lim _{n \rightarrow \infty} a_{n} \neq L$ if for some positive $\epsilon$, there is NO integer $N>0$ satisfying $\left|a_{n}-L\right|<\epsilon$ whenever $n>N$.

Example 18.8. Given an example of a sequence that has no limit.

### 18.3 Properties and Theorems for Sequences

Let $\left(a_{n}\right),\left(b_{n}\right)$ be sequences, and let $c$ be a constant. Then if $a_{n} \rightarrow L$ and $b_{n} \rightarrow K$ where L and K are finite (so $a_{n}$ and $b_{n}$ are convergent, then
a) $\lim _{n \rightarrow \infty}\left(a_{n} \pm b_{n}\right)=$
b) $\lim _{n \rightarrow \infty}\left(c a_{n}\right)=$
c) $\lim _{n \rightarrow \infty}\left(a_{n} \cdot b_{n}\right)=$
d) $\lim _{n \rightarrow \infty}\left(\frac{a_{n}}{b_{n}}\right)=$
e) $\lim _{n \rightarrow \infty} a_{n}^{P}=$ $\qquad$ if $\qquad$ and $\qquad$

Sequences as Functions If $\lim _{n \rightarrow \infty} f(n)=L$ and $f(n)=a_{n}$ where $n$ is an integer, then $\lim _{n \rightarrow \infty} a_{n}=$ Example 18.9. Determine the limit of $a_{n}=\left\{\frac{n^{2}}{\ln \left(n^{2}\right)}\right\}_{n=2}^{\infty}$ if it exists.

Continuous Functions of Sequences If $\lim _{n \rightarrow \infty} a_{n}=L$ and f is a continuous function at L , then $\lim _{n \rightarrow \infty} f\left(a_{n}\right)=$ $\qquad$

Example 18.10. Determine the limit of $a_{n}=\left\{e^{\frac{1}{2 n}}\right\}_{n=-5}^{\infty}$ if it exists.

Example 18.11. Determine the limit of $a_{n}=\{\cos (n \pi)\}_{n=-5}^{\infty}$ if it exists.

Example 18.12. Intuitively what does the sequence $a_{n}=\left\{\frac{(-1)^{n+1}}{2 n}\right\}$ seem to approach? Can we really treat it like a function of $n$ ?

Squeeze Theorem for Sequences: If $b_{n} \leq a_{n} \leq c_{n}$ for $n \geq n_{0}$ and $\lim _{n \rightarrow \infty} b_{n}=\lim _{n \rightarrow \infty} c_{n}=L$, then
Example 18.13. Determine the limit of $a_{n}=\left\{\frac{\cos n}{n}\right\}_{n=1}^{\infty}$ if it exists.

The most romantic theorem in mathematics yields to a corollary since $\leq a_{n} \leq$
Absolute Convergence for Sequences: If $\lim _{n \rightarrow \infty}\left|a_{n}\right|=0$, then $\lim _{n \rightarrow \infty} a_{n}=$ $\qquad$
Example 18.14. What is the limit of $a_{n}=\frac{(-1)^{n}}{n}$ ?

Note: Sometimes determining the limit of sequences is difficult, but we can tell whether or not a limit does exist.

Definition: A sequence is monotonic if it is either increasing or decreasing.
$<a_{n}>$ is increasing if ___ for all $n \geq 1$
$<a_{n}>$ is decreasing if__ for all $n \geq 1$
$\left.<a_{n}\right\rangle$ is strictly increasing (decreasing) if we change the inequalities to $>$ or $<$.
Definition: $<a_{n}>$ is bounded above if there exists a number $M>0$, such that $\qquad$ for all $n \geq 1$
$\left.<a_{n}\right\rangle$ is bounded below if there exists a number $m>0$, such that $\qquad$ for all $n \geq 1$

A sequence is bounded if it is bounded above AND bounded below.
Note: We can have eventually bounded above/below sequences and eventually monotone sequences.

Example 18.15. Determine whether the sequence $a_{n}=\left\{1+\frac{1}{n}\right\}_{n=1}^{\infty}$ is bounded. Is it monotonic?

Example 18.16. Give an example of a sequence that has the following properties:
a) Bounded but not monotonic;
b) Monotone but not bounded below;
c) Monotone but not bounded above;
d) Monotone but not bounded ;
e) Monotone and bounded;

Monotonic Sequence Theorem: Every bounded, monotonic sequence is proof omitted. See text.

Example 18.17. Determine whether the sequence $\left\{a_{n}\right\}_{n=1}^{\infty}$ has a limit where $a_{1}=1$ and $a_{n+1}=1+\frac{1}{a_{n}}$.

### 18.4 ICE - Sequences

1. Construct 3 different sequences that all converge to 4 -one increasing, one decreasing, and one neither increasing nor decreasing.
2. Determine whether the following statements are True or false. Include reasons or counterexamples:
a) Every bounded sequence is convergent.
b) Every sequence that is bounded above is convergent.
c) Every monotonic sequence is convergent.
d) If $a_{n}=\left\{1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \frac{1}{5}, \ldots\right\}$ and $b_{n}=\left\{1,0, \frac{1}{2}, 0, \frac{1}{3}, 0, \ldots\right\}$, then $\lim _{n \rightarrow \infty} a_{n}=\lim _{n \rightarrow \infty} b_{n}$.
e) An alternating sequence can be convergent.
f) The only way a sequence can diverge is if the terms tend to infinity as $n$ tends to infinity.
3. Determine whether the following sequences converge or diverge. If they converge find the limit.
a) $a_{n}=\left\{\frac{\sqrt{n}}{1+\sqrt{n}}\right\}_{n=1}^{\infty}$
b) $b_{n}=\left\{\frac{-1}{4}, \frac{2}{9}, \frac{-3}{16}, \frac{4}{25}, \ldots\right\}$
c) $c_{n}=\{2,7,9,2,7,9, \ldots\}_{n=1}^{\infty}$
d) $d_{n}=\left\{\frac{n}{1+\sqrt{n}}\right\}_{n=1}^{\infty}$
4. Determine for which x , the sequence $\left\{x^{n}\right\}_{n=1}^{\infty}$ is convergent.

## 19 Series

### 19.1 Sequence of Partial Sums

If we add up an infinite sequence $\left\{a_{n}\right\}_{n=1}^{\infty}$ we get an infinite sum of the form:
We call this a series and we denote the series as

Each series has a sequence of $\qquad$ sums $\left\{S_{n}\right\}$.
The $\mathrm{n}^{\text {th }}$ term of this sequence is the sum of the first $\qquad$ terms of $\left\{a_{n}\right\}$.
So $S_{1}=$
$S_{2}=$
$S_{3}=$
$S_{4}=$
$S_{n}=$
Key Idea: If our sequence of PARTIAL $\operatorname{SUMS}\left\{S_{n}\right\}$ has a limit L. Then the SERIES $\sum_{n=1}^{\infty} a_{n}$ converges to L. That is, $\sum_{n=1}^{\infty} a_{n}=$
If our sequence of PARTIAL SUMS $\left\{S_{n}\right\}$ diverges, then the series $\sum_{n=1}^{\infty} a_{n}$ $\qquad$

Example 19.1. For the following series, find the first 4 terms of the sequence of partial sums and use it to find an expression for the $n^{\text {th }}$ partial sum $S_{n}$. Determine if the series converge or diverge? a) $\sum_{n=1}^{\infty} 2 n$
b) $\sum_{n=1}^{\infty} \frac{1}{n(n+1)}$.
c) $\sum_{n=1}^{\infty}(-1)^{n}$

### 19.2 Geometric Series

Consider the series of the form $\sum_{n=0}^{\infty} a r^{n}$

What are some of the partial sums?
$a$ is the $\qquad$ term of the series and $r$ is called the ratio.
Sum of A Geometric Series: If $a$ and $r$ are real numbers and $|r|<1$ then $\sum_{n=0}^{\infty} a r^{n}=\frac{a}{1-r}$. If $|r| \geq 1$, the series diverges.

Pf. Omitted (see text).

Sometimes a geometric series show up in different forms:
$\sum_{n=1}^{\infty} a r^{n}$
$\sum_{n=1}^{\infty} a r^{n+1}$

$$
\begin{aligned}
& \sum_{n=0}^{\infty} a r^{n-3} \\
& \sum_{n=0}^{\infty} a \frac{r^{n}}{q^{m}}
\end{aligned}
$$

For each of these, you want to make sure the series is actually a geometric series, which sometimes requires doing some algebra to simplify it enough to identify the ratio (that is get it in the form of: $\qquad$ ),
you actually don't need to do all the algebra to get it in the standard form: $\sum_{n=0}^{\infty} a r^{n}$ because...
Once you have identified the ratio, and determined it is a convergent geometric series, Dr. Harsy recommends the following way to determine the sum:

Better Way to Remember Sum of a Geo Series: $\sum$ geo series=

Example 19.2. Evaluate the following geometric series.
a) $\sum_{n=2}^{\infty} \frac{1}{5^{n}}$
b) $\sum_{n=2}^{\infty}\left(\frac{7}{5}\right)^{n}$
c) $\sum_{n=0}^{\infty} e^{-n}$
d) $\sum_{n=1}^{\infty} \frac{2^{n}}{5^{n+1}}$
e) $\sum_{n=1}^{\infty}\left(\frac{1}{2^{n}}-\frac{1}{2^{n+2}}\right)$

### 19.3 Telescoping Series

We can calculate a geometric series using a formula, but not many infinite series can be solved using a formula. But we can do this when we have another class of series called $\qquad$ series.

Example 19.3. Evaluate $\sum_{n=1}^{\infty}\left(\frac{1}{2^{n}}-\frac{1}{2^{n+2}}\right)$ (not using geometric series.)

Example 19.4. Evaluate $\sum_{n=1}^{\infty}\left(\frac{1}{(n+1)(n+2)}\right)$

### 19.4 Properties of Series

The Harmonic Series: The Harmonic Series $\sum_{n=1}^{\infty} \frac{1}{n}$ is divergent.
Pf. See Text. You can show the for each term of the partial sums $S_{2^{n}}>1+\frac{n}{2}$ so then $S_{n} \rightarrow \infty$. So the series diverges.

Theorem If $\sum_{n=1}^{\infty} a_{n}$ is convergent then $\lim _{n \rightarrow \infty} a_{n}=$
CAREFUL: The converse of this statement is not true.
Just because $\lim _{n \rightarrow \infty} a_{n}=0$, does NOT mean $\sum_{n=1}^{\infty} a_{n}$ is convergent!!!
Remember the Harmonic Series: $\sum_{n=1}^{\infty} \frac{1}{n}$ diverges even though $\lim _{n \rightarrow \infty} \frac{1}{n}=$ $\qquad$
We can use the theorem just to show that a sequence does not converge.
Hence the next theorem:
Test for Divergence If $\lim _{n \rightarrow \infty} a_{n} \neq 0$ or does not exist, then $\sum_{n=1}^{\infty} a_{n}$ $\qquad$
Example 19.5. Show that $\sum_{n=1}^{\infty} \frac{-n^{2}-n+5}{5 n^{2}+1}$ is divergent.

Example 19.6. Can we use the Test for Divergence for $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$ ?

## Properties of Series

Let $\sum_{n=1}^{\infty} a_{n}=L, \sum_{n=1}^{\infty} b_{n}=M$ (so we have CONVERGENT series), and let $c$ be a constant. Then
a) $\sum_{n=1}^{\infty}\left(a_{n} \pm b_{n}\right)=$
b) $\sum_{n=1}^{\infty} c a_{n}=$

### 19.5 ICE - Series

Two sides!

1. Determine if the following series converge or diverge. Evaluate those that converge.
a) $\sum_{n=1}^{\infty} \frac{2}{(-5)^{n}}$.
b) $\sum_{n=1}^{\infty} \frac{2^{n-1}}{(-5)^{n}}$. [Hint: factor out a $\frac{-1}{5}$ and write this as a geometric series.]
c) $\sum_{n=1}^{\infty} \frac{2}{n^{2}+4 n+3}$. [Hint: Using partial fraction, we see that $\frac{2}{n^{2}+4 n+3}=\frac{1}{n+1}-\frac{1}{n+3}$.]
d) $\sum_{n=1}^{\infty}\left(\frac{5}{4^{n}}+\frac{4}{n}\right)$
2. Find the values for $x$ for which $\sum_{n=1}^{\infty} \frac{(x+3)^{n}}{2^{n}}$ converges. Then find the sum of the series for those values of x .
3. The $n^{\text {th }}$ partial sum of a series of $a_{n}$ is $s_{n}=3-\frac{n}{2^{n}}$. Find $a_{n}$ and $\sum_{n=1}^{\infty} a_{n}$.

## 20 Tests for Convergence for Series

Up until now, we have had the following ways to determine whether or not a series, $\sum a_{n}$, converges:

1. Find a formula for the sequence of partial sums $S_{n}$. If $S_{n}$ converges to a finite limit then $\sum a_{n}$ converges. If $S_{n}$ diverges to $\infty,-\infty$, or the limit doesn't exist, $\sum a_{n}$ diverges. Note: When we recognize a telescoping series, we find $S_{n}$
2. Write $\sum a_{n}$ in the form of a geometric series, $\sum a r^{n}$ (if you can, remember this doesn't often work ). If $|r|<1$, our geometric series converges. If $|r| \geq 1$, the series diverges.
3. Use the Test for Divergence. But remember this only tells us if a series diverges and not if it converges!

The next week we will be talking about more tests for convergence. Remember this is important because eventually we will want to use series to model functions so making sure these models converge is important.

### 20.1 The Test for Divergence

The Test for Divergence: If $\lim _{n \rightarrow \infty} a_{n} \neq 0$ or does not exist, then $\sum_{n=1}^{\infty} a_{n}$ diverges.
Example 20.1. Determine whether the series $\sum_{1}^{\infty} \frac{2 n+1}{n-3}$ converges or diverges.

Example 20.2. Determine whether the series $\sum_{1}^{\infty} \frac{1}{\sqrt{n}}$ converges or diverges.

### 20.2 Integral Test

Recall in our notes on Improper Integrals, we determined that $\int_{1}^{\infty} \frac{1}{x} d x$ and $\int_{1}^{\infty} \frac{1}{x^{2}} d x$
In fact we can confirm that $\int_{1}^{\infty} \frac{1}{x^{k}} d x$ diverges for $\qquad$ and converges for $\qquad$
Note: This is not true for $\int_{0}^{1} \frac{1}{x^{k}} d x$.
We can use improper integrals to help us determine whether or not our series converge:
Integral Test for Series: Suppose $f$ is a 1) continuous, 2) positive, and 3) decreasing (or eventually decreasing) function on $[b, \infty)$. Let $a_{n}=f(n)$. Then

1) If $\int_{b}^{\infty} f(x) d x$ is convergent then $\sum_{n=b}^{\infty} f(n)=\sum_{n=b}^{\infty} a_{n}$ is
2) If $\int_{b}^{\infty} f(x) d x$ is divergent then $\sum_{n=b}^{\infty} f(n)=\sum_{n=b}^{\infty} a_{n}$ is $\qquad$
Note: You must always justify the use of this test by checking that our function satisfies the conditions of the theorem.

Sometimes you can modify this, if your function is eventually decreasing after $\mathrm{n}=\mathrm{k}$ and use $\int_{k}^{\infty} f(x) d x$ for the test.

We will omit the proof and instead explore the reasoning for this using a few examples.
Let's pick a k such that $\int_{1}^{\infty} \frac{1}{x^{k}} d x$ converges.

Now let's pick a k such that $\int_{1}^{\infty} \frac{1}{x^{k}} d x$ diverges.

Example 20.3. Use the integral test to determine whether $\sum_{n=1}^{\infty} \frac{n}{n^{2}+1}$ converges or diverges.
Remember you always MUST justify that you can use the integral test.

Example 20.4. Use the integral test to determine whether $\sum_{n=2}^{\infty} \frac{1}{n \ln (n)^{2}}$ converges or diverges.

### 20.3 The P-Test

Using our results from improper integrals, we know $\int_{1}^{\infty} \frac{1}{x^{p}} d x$ diverges for $\qquad$ and converges for $\qquad$ .
This gives us a very useful test when we apply the integral test. We use it so often, we often think of it as its own thing:

P-test for Series: $\sum_{n=1}^{\infty} \frac{1}{n^{p}}$ is divergent if ___ and convergent if $\qquad$
Definition: A series in the form of $\sum \frac{1}{n^{P}}$ is called a $P$-Series.

Example 20.5. a) Give an example of a $P$-Series that converges.
b) Now give an example of a $P$-Series that diverges.

Example 20.6. Determine if the sum of the sequence $\left\{1, \frac{1}{4 \sqrt{2}}, \frac{1}{9 \sqrt{3}}, \frac{1}{16 \sqrt{4}}, \frac{1}{25 \sqrt{5}}, \ldots\right\}$ converges or diverges.

### 20.3.1 Estimating Sums of Series using Improper Integrals

Important: If we use our integral test for $a_{n}=f(n)$ and $\int_{1}^{\infty} f(x) d x=B<\infty$, this DOES NOT mean that $\sum_{n=1}^{\infty} a_{n}=B$. [This makes sense if we go back to our examples from the first page.]
For example: $\int_{1}^{\infty} \frac{1}{x^{2}} d x=1$. But $\sum_{n=1}^{\infty} \frac{1}{n^{2}}=\frac{\pi^{2}}{6}$
So far we have used improper integrals to determine whether or not a series converges. We can also use improper integrals to approximate the sum of the series.

Remember we look at the sequence of partial sums, $S_{n}$ to determine the sum of a series $\sum_{n=1}^{\infty} a_{n}$. If $\lim _{n \rightarrow \infty} S_{n}=S$, then $\sum_{n=1}^{\infty} a_{n}=S$. This means that the error made for the $\mathrm{n}^{t h}$ partial sum, denoted $R_{n}$, should be getting relatively small as $n$ increases.

So the error in the approximating our sum using $S n$ is $R_{n}=S-S_{n}=$

So $R_{n}=$

Remainder Estimate for the Integral Test: Suppose $f(n)=a_{n}$, where $f$ is a continuous, positive, decreasing function for $x \geq n$ and $\sum_{n=1}^{\infty} a_{n}$ is convergent. If $R_{n}=S-S_{n}$,
then $\qquad$ $\leq R_{n} \leq$ $\qquad$
Since $R_{n}=S-S_{n} \Rightarrow$ $\qquad$ $+\quad \leq S \leq$ $\qquad$ $+$

Example 20.7. How many terms of the series $\sum_{n=1}^{\infty} \frac{1}{n^{2}}$ must be summed to obtain an approximation that is within $10^{-2}$ of the exact value of the series?

### 20.3.2 ICE - Integral and P-Test

Two sides!

1. Explain why the integral test can't be used to determine whether $\sum_{n=1}^{\infty} \frac{\cos (\pi n)}{\sqrt{n}}$ converges or diverges.
2. For what values of p does the sum $\sum_{n=2}^{\infty} \frac{1}{n(\ln (n))^{p}}$ converge.
3. Euler found that the exact sum of $\sum_{n=1}^{\infty} \frac{1}{n^{2}}=\frac{\pi^{2}}{6}$.

Use this to find the sum of $\sum_{n=1}^{\infty} \frac{1}{(n+1)^{2}}$ AND $\sum_{n=3}^{\infty} \frac{1}{(n+1)^{2}}$.

### 20.4 Direct Comparison Test for Series

Recall, we could determine whether an improper integral converged or diverged by comparing it with another improper integral.
So if $f$ and $g$ are continuous functions with $0 \leq g(x) \leq f(x)$ for $x \geq a$, then

1) If $\int_{a}^{\infty} f(x) d x$ is convergent, then $\int_{a}^{\infty} g(x) d x$
2) If $\int_{a}^{\infty} g(x) d x$ is divergent, then $\int_{a}^{\infty} f(x) d x$ $\qquad$
We can do the same thing with series!
Direct Comparison Test for Series: Suppose $\sum a_{n}$ and $\sum b_{n}$ are series with POSITIVE terms. Then
3) If $a_{n} \leq b_{n}$ for all $n$, and $\sum b_{n}$ $\qquad$ , then $\sum a_{n}$ $\qquad$
4) If $a_{n} \geq b_{n}$ for all $n$, and $\sum b_{n}$ $\qquad$ then $\sum a_{n}$
Note: Just like with integral comparison. If $a_{n} \leq b_{n}$ and $\sum b_{n}$ diverges OR if $a_{n} \geq b_{n}$ and $\sum b_{n}$ converges, then we know $\qquad$ !!!

Helpful Series to compare with:

Example 20.8. Determine whether $\sum_{n=3}^{\infty} \frac{5}{\sqrt{n-2}}$ converges or diverges.

Example 20.9. Determine whether $\sum_{n=2}^{\infty} \frac{\ln (n)}{n^{4}}$ converges or diverges.

### 20.5 Limit Comparison Test for Series

We use the comparison test if there is an obvious series we can compare our series to. But sometimes life is HARD!
What about if we had $\sum_{n=3}^{\infty} \frac{5}{\sqrt{n+2}}$ for example 1 instead of $\sum_{n=3}^{\infty} \frac{5}{\sqrt{n-2}}$

Rather than trying to find a series to compare to we can use another test.
Limit Comparison Test: Suppose $\sum a_{n}$ and $\sum b_{n}$ are series with POSITIVE terms AND $\lim _{n \rightarrow \infty} \frac{a_{n}}{b_{n}}=L$. Then

1) If $L$ is finite $(0<L<\infty)$ then $\sum a_{n}$ and $\sum b_{n}$ either BOTH $\qquad$ or $\qquad$
2) If $\mathrm{L}=0 \mathrm{AND} \sum b_{n}$ $\qquad$ then $\sum a_{n}$
3) If $L=\infty$ and $\sum b_{n}$ $\qquad$ then $\sum a_{n}$ $\qquad$

Example 20.10. Use the limit comparison test to determine if $\sum_{n=3}^{\infty} \frac{5}{\sqrt{n+2}}$ converges or diverges.

Example 20.11. Determine if $\sum_{n=1}^{\infty} \frac{5 n^{5}-2 n^{2}+3}{3 n^{7}-n+7}$ converges or diverges.

Example 20.12. What happens if we try to use the limit comparison test to determine if $\sum_{n=3}^{\infty} \frac{1}{n^{2}+5}$ converges or diverges by comparing it to $\sum_{n=3}^{\infty} \frac{1}{n}$ ?

### 20.5.1 Estimating Sums of Series Using Comparison Series

Recall the error made for the $\mathrm{n}^{\text {th }}$ partial sum, $R_{n}$ of $\sum a_{n}$ is $R_{n}=S-S_{n}=$ Suppose we compare $\sum a_{n}$ with $\sum b_{n}$. Let $T_{n}$ represent the error of the $\mathrm{n}^{\text {th }}$ partial sum of $\sum b_{n}$.
Then if $a_{n} \leq b_{n}$ for all n , then $\qquad$
If $b_{n}$ is a p-series, then we can use the Remainder Estimate for the Integral Test and $R_{n} \leq T_{n} \leq \int_{n}^{\infty} f(x) d x$ where $f(n)=a_{n}$.
If $b_{n}$ is a geometric series we also have that $R_{n} \leq T_{n} \leq \int_{n}^{\infty} f(x) d x$ where $f(n)=a_{n}$.
Example 20.13. Estimate the error in approximating $\sum_{n=3}^{\infty} \frac{n}{3^{n}(n+1)}$ if we use the sum of the first 5 terms, $S_{5}$, to approximate the series.

### 20.5.2 ICE - Comparison Tests

1. Determine if the following series converge or diverge. Two sides!
a) $\sum_{n=1}^{\infty} \frac{2 n^{2}+n^{5}-1}{3 n^{9}+2}$.
b) $\sum_{n=1}^{\infty} \frac{1+\cos (n)}{\sqrt{2}^{n}}$.
c) $\sum_{n=5}^{\infty} \frac{1}{n-2 \sqrt{n}}$.
d) $\sum_{n=1}^{\infty} \frac{1}{n^{2}+2 \sqrt{n}}$.
e) $\sum_{n=1}^{\infty} \frac{\sin (n)+n+9}{(n+2)^{3}}$.

### 20.6 The Alternating Series Test

So far we can test series using the Integral Test, P-Test, the Direct Comparison Test, and The Limit Comparison Test. But all of these require us to have series with only terms. What if we have some negative terms along with our nonnegative terms?

We have a test for series that alternating between positive and negative terms. An alternating series can be written in the form: $\sum_{n=k}^{\infty}(-1)^{n+1} a_{n}$
Example: $\sum_{n=1}^{\infty}(-1)^{n+1}$ is alternating

## Alternating Series Test:

The alternating series $\sum(-1)^{n+1} a_{n}$ converges if...

1) The terms of $a_{n}$ are nonincreasing. That is $a_{n+1} \leq a_{n}$. [Note: eventually nonincreasing is ok.]
2) $\lim _{n \rightarrow \infty} a_{n}=0$
and diverges if either of the two above conditions fails.
Warning: If we do NOT have an alternating series and have a series with all positive terms, then $\lim _{n \rightarrow \infty} a_{n}=0$ $\qquad$ imply convergence. This is a special case for an alternating series.

Example 20.14. Determine whether $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n}$ converges or diverges.

The Alternating Harmonic Series: $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n}$ converges to $\ln (2)$
Example 20.15. Determine whether $\sum_{n=2}^{\infty} \frac{(-1)^{n-1}}{\sqrt{n}-1}$ converges or diverges.

Example 20.16. Determine if $\sum_{n=1}^{\infty} \frac{(-1)^{n} n^{4}}{3 n^{4}-5}$ converges or diverges.

Example 20.17. Determine if $\sum_{n=1}^{\infty} \frac{\sin \left(\frac{\pi n}{2}\right)}{n}$ converges or diverges.

### 20.6.1 Estimating Remainders in Alternating Series

The error made for the $\mathrm{n}^{\text {th }}$ partial sum, $R_{n}$ (the remainder) of a convergent alternating series $\sum(-1)^{n+1} a_{n}$ is bounded by the $(n+1)^{t h}$ term of the sequence.
That is $\left|R_{n}\right| \leq$

Example 20.18. How many terms of $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n^{8}}$ do we need to take to get the error bounded by $\frac{1}{10^{8}}$ ?

### 20.7 Absolute Convergence Test and Conditional Convergence

Any sequence $a_{n} \leq \ldots$ and so we can always compare $\sum a_{n} \leq$ with $\qquad$ By the comparison test, if $\sum\left|a_{n}\right|$ converges then so does $\qquad$
Definition: A series $\sum a_{n}$ is $\qquad$ convergent if $\sum\left|a_{n}\right|$

Absolute Convergence Test (Special case of Comparision Test):
If a series is absolutely convergent, it $\qquad$
Can we have a series that converges, but is not absolutely convergent?

Example:

Definition: A series that is convergent but not absolutely convergent is called $\qquad$ convergent.

Example 20.19. Is $\sum_{n=1}^{\infty} \frac{(-1)^{n}}{\sqrt[4]{n}}$ absolutely convergent, conditionally convergent, or divergent?

Example 20.20. Determine whether $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{\sqrt{n^{5}}}$ is absolutely convergent, conditionally convergent, or divergent?

### 20.7.1 ICE - Alternating Series Test

1. Determine which of the following are true or false. Explain or give a counter example.
1) A series that converges must converge absolutely.
2) A series that converges absolutely must converge.
3) A series that converges conditionally must converge.
4) If $\sum a_{n}$ diverges then $\sum\left|a_{n}\right|$ diverges.
5) If $\sum a_{n}$ converges conditionally then $\sum\left|a_{n}\right|$ diverges.
6) If $\sum a_{n}^{2}$ converges then $\sum a_{n}$ converges.
2. Is $\sum_{n=2}^{\infty} \frac{(-1)^{n}}{\ln (n)}$ convergent? absolutely convergent? [Hint: use alt. series test and comparision]
3. Is $\sum_{n=1}^{\infty}(-1)^{n} \frac{n}{\sqrt{n^{2}+1}}$ convergent? absolutely convergent?
4. Is $\sum_{n=1}^{\infty} \frac{4^{n}}{3^{n}-1}$ convergent? absolutely convergent?
5. For which values of $p$ is $\sum_{n=2}^{\infty} \frac{(-1)^{n-1}}{n^{p}}$ convergent? absolutely convergent?

### 20.8 The Ratio Test

Recall, $n!=$
So $5!=$
Consider the series $\sum_{n=1}^{\infty} \frac{1}{n!}$. Can we determine whether it converges or diverges?
Ratio Test: Given a series $\sum a_{n}$. Let $\lim _{n \rightarrow \infty}\left|\frac{a_{n+1}}{a_{n}}\right|=L$.

1) If $0 \leq L<1$, then $\sum a_{n}$ is $\qquad$ .
2) If $L>1$, then $\sum a_{n}$ is
3) If $L=1$, then the Ratio Test is inconclusive. We don't know if $\sum a_{n}$ diverges or converges.

Example 20.21. Determine if $\sum_{n=1}^{\infty} \frac{1}{n!}$ converges or diverges.

Example 20.22. Determine whether $\sum_{n=1}^{\infty} \frac{n!}{100!}$ converges or diverges.

Example 20.23. Use the Ratio Test to determine whether $\sum_{n=1}^{\infty} \frac{1}{n}$ converges or diverges.

### 20.9 The Root Test

Consider the series $\sum_{n=1}^{\infty}\left(\frac{5 n^{2}-3}{8 n^{2}+7}\right)^{n}$. Can we determine whether it converges or diverges?

Root Test: Given a series $\sum a_{n}$. Let $\lim _{n \rightarrow \infty} \sqrt[n]{\left|a_{n}\right|}=K$.

1) If $0 \leq K<1$, then $\sum a_{n}$ is $\qquad$ .
2) If $K>1$, then $\sum a_{n}$ is $\qquad$
3) If $K=1$, then the Root Test is inconclusive.

Example 20.24. Determine if $\sum_{n=1}^{\infty}\left(\frac{5 n^{2}-3}{8 n^{2}+7}\right)^{n}$ converges or diverges.

Example 20.25. Determine if $\sum_{n=1}^{\infty} \frac{(-1)^{n+1} n^{2} 3^{n}}{(n+2)^{2}}$ converges or diverges.

Example 20.26. Determine if $\sum_{n=1}^{\infty} \frac{\cos (4 n)}{4^{n}}$ converges or diverges.

### 20.9.1 ICE - Ratio and Root Tests

1. Determine if the following series are convergent or divergent.
a) $\sum_{n=1}^{\infty} \frac{n^{3}}{4^{n}}$
b) $\sum_{n=1}^{\infty} \frac{n!}{e^{n}}$
c) $\sum_{n=1}^{\infty} \frac{2^{n}}{3^{n}}$
d) $\sum_{n=1}^{\infty} \frac{(10)^{n}}{\arctan (n)^{n}}$
e) Using the Root test what values of a, will $\sum_{n=1}^{\infty} a^{n}$ converge for? diverge? Does this agree with our geometric series test?
f) $\sum_{n=1}^{\infty} \frac{n^{n}}{4^{1+4 n}}$ [Hint: Factor out a $\frac{1}{4}$.]

## 21 Series Review

Objective 1: Strategy for Series
So many tests for series! How do we choose?!?!
It helps to recognize the general form of the series and use the test for that form.
My best suggestion for gaining intuition about series strategy is exactly what I suggested when learning integration techniques...
I have also created a flowchart that can help you (see next page).
Game plan for Series:

1. Check for divergence using the Test for Divergence to determine if the sequence we are summing does not have a limit of $\qquad$
Form of Series:

Condition for convergence: Condition for divergence:

Comment: Cannot be used to prove convergence!
2. Alternating Series Test: I have an alternating series or can rewrite my series to be alternating. Form of Series:

Condition for convergence: Condition for divergence:

Comment: The remainder/error $R_{n} \leq a_{n+1}$
3. Geometric Series: I see a Geometric Series! Form(s) of Series:

Condition for convergence: Condition for divergence:

Comment: Limit of the series is
4. P-Series: I see a P-Series!

Form of Series:

Condition for convergence: Condition for divergence:

Comment: Use for comparison tests!
5. Direct Comparison Test: I see a series that looks similar to a geometric or p-series, but is a little more complicated.
Form of Series:

Condition for convergence: Condition for divergence:

Comment: You have to come up with the series, $\sum b_{n}$, as a comparison. Remember to justify that $a_{n} \leq b_{n}$ or $a_{n} \geq b_{n}$. Also if $\sum a_{n}$ has some negative values, you can compare with $\sum\left|a_{n}\right|$.
6. Limit Comparison Test: It looks like I want to use a Comparison Test, but justifying the comparison seems tough.

Form of Series:

Condition for convergence:
Condition for divergence:

Comment: You have to come up with the series, $\sum b_{n}$ to compare to and find $\lim _{n \rightarrow \infty} \frac{a_{n}}{b_{n}}$
7. Ratio Test: I see a factorial ( $n!$ ) or products and too complicated to compare to a p-series or geometric series.
Form of Series:

Condition for convergence:
Condition for divergence:

Comment: If $\lim _{n \rightarrow \infty} \frac{\left|a_{n+1}\right|}{\left|a_{n}\right|}=1$, we know $\qquad$ $!$
8. Root Test: I see an $n^{\text {th }}$ power.

Form of Series:

Condition for convergence:
Condition for divergence:

Comment: If $\lim _{n \rightarrow \infty} \sqrt[n]{\left|a_{n}\right|}=1$, we know $\qquad$ !
9. Integral Test: I see a function in which $f(n)=a_{n}$ and I can easily calculate $\int_{k}^{\infty} f(x) d x$ Form of Series:

Condition for convergence: Condition for divergence:

Comment: You must justify the use of the test! And remember the value of the integral is NOT the value of the series.
10. Telescoping Series: I see a difference of two fractions (like $\frac{1}{n}-\frac{1}{n+2}$ ) or I see that the sequence I am summing looks like I could use partial fractions. Then I can find an expression for the sequence of partial fractions and take $\lim _{n \rightarrow \infty} S_{n}$ which will be the sum of my series. Form of Series:

Condition for convergence: Condition for divergence:

Comment: Sometimes you can expand the fraction and use a comparison test instead!
11. Finding Sequence of Partial Sums: I am given the sequence of partial sums $S_{n}$ or I can easily find it. Then $\sum a_{n}=\lim _{n \rightarrow \infty} S_{n}$
Form of Series:

Condition for convergence:
Condition for divergence:

Example 21.1. For each Series, suggest one approach that you think is appropriate to determine whether the series converges or diverges.
a) $\sum_{n=1}^{\infty} \frac{2^{n}}{e^{n}}$
b) $\sum_{n=2}^{\infty}\left(\frac{3 n^{2}+1}{n^{2}-1}\right)^{n}$
c) $\sum_{n=1}^{\infty}\left[\left(\frac{1}{3}\right)^{n}-\left(\frac{2}{3}\right)^{n-1}\right]$
d) $\sum_{n=1}^{\infty} \sin (n)$
e) $\sum_{n=1}^{\infty} \frac{3 n^{2}+1}{\sqrt{n^{3}+4}}$
f) $\sum_{n=1}^{\infty} n e^{-n}$
g) $\sum_{n=1}^{\infty} \frac{\ln n^{2}}{n^{5}}$
h) $\sum_{n=1}^{\infty}(-1)^{n} \frac{10^{n}}{n!}$
i) $\sum_{n=1}^{\infty} \frac{\ln n^{2}}{n^{2}}$
j) $\sum_{n=1}^{\infty} \frac{n}{n^{2}+1}$
k) $\sum_{n=1}^{\infty} \frac{1}{1+0.4^{n}}$
l) $\sum_{n=1}^{\infty} \frac{e^{\frac{1}{n}}}{n^{2}}$

### 21.1 Flowchart Summarizing Most Series Convergence Tests

### 21.2 Infinite Series Convergence Testing Practice

Here are some good practice series for you to work on during your own study time. For the following series, your task is to make the strongest statement about convergence that is possible.

1. $\sum_{n=3}^{\infty} \frac{(\ln (n))^{2}}{n}$
2. $\sum_{n=1}^{\infty} \frac{1}{n \cdot 7^{n}}$
3. $\sum_{n=2}^{\infty} \frac{n}{e^{n}}$
4. $\sum_{n=1}^{\infty} \frac{1}{(5 n)^{3}}$
5. $\sum_{n=1}^{\infty} \frac{4^{n}}{n!}$
6. $\sum_{n=1}^{\infty} \frac{1}{e^{2 n+3}}$
7. $\sum_{n=1}^{\infty} \frac{n}{n^{3}+4}$
8. $\sum_{n=1}^{\infty} \frac{n^{3}+4}{n}$
9. $\sum_{n=3}^{\infty} \frac{4^{n}(n+2)(2 n)!}{(2 n+2)!}$
10. $\sum_{n=2}^{\infty} \frac{1}{\sqrt{n^{2}-1}}$
11. $\sum_{n=0}^{\infty} \frac{n^{2}}{\left(n^{3}+4\right)^{2}}$
12. $\sum_{n=0}^{\infty} \frac{6^{n}+7^{n}}{8^{n}}$
13. $\sum_{n=1}^{\infty} \frac{e^{n}}{e^{n}+5}$
14. $\sum_{n=3}^{\infty} \frac{4^{n}}{(n!)^{2}}$
15. $\sum_{n=0}^{\infty} \frac{n^{3}}{\left(n^{4}+1\right)^{2}}$
16. $\sum_{n=0}^{\infty} \frac{1+2^{n}}{3^{n}}$
17. $\sum_{n=1}^{\infty} \frac{\cos (n)}{n^{3}}$
18. $\sum_{n=0}^{\infty} \frac{1}{\left(\frac{5}{4}\right)^{n}+\left(\frac{1}{4}\right)^{n}}$
19. $\sum_{n=1}^{\infty} \frac{n^{2}+4}{3-2 n^{2}}$
20. $\sum_{n=1}^{\infty} \frac{1}{e^{n}+n}$
21. $\sum_{n=1}^{\infty} n^{-7 / 4}$
22. $\sum_{n=1}^{\infty} \frac{(-7)^{n}}{n+10000}$
23. $\sum_{n=1}^{\infty} \frac{(-1)^{n} e^{n}}{e^{n}-3}$
24. $\sum_{n=0}^{\infty} e^{3-n}$
25. $\sum_{n=1}^{\infty} \frac{(-2)^{n}(n+1)}{5^{n}}$

Flowchart modified by Dr. Harsy from Dr. Edward Kim's original ETEXdocument.

## 22 Power Series

## We got the Power -Power Series!

So far we have primarily discussed series of numbers. Could we have series with variables?

What if we replaced the ratio (r) in our geometric series $\sum r^{n}$ with a variable x ?
$\sum_{0}^{\infty} x^{n}$, when will this series converge?
What if we replaced the ratio with $(x-a) ? \quad \sum_{0}^{\infty}(x-a)^{n}$ When will it converge now?

We call the series above a $\qquad$ series. It is a series in the form:
$\sum_{n=0}^{\infty} c_{n}(x-a)^{n}=$
Note: $c_{n}$ is a sequence of $\qquad$ depending on $n$ and should not be functions of $x$.

Sometimes, we call this a power series in $(x-a)$ or a power series centered at/about The simplest power series is when we take $a=$ $\qquad$ Then we get this power series:

The "Powerful Idea": When you have $\sum_{n=0}^{\infty} c_{n}(x-a)^{n}$, you have a battle between adding up infinite terms and $(x-a)^{n}$ becoming smaller and smaller. If $(x-a)^{n}$ becomes small enough, our infinite sum may converge!

Power Series Centered at a: $\sum_{n=0}^{\infty} c_{n}(x-a)^{n}$ has 3 possibilities:

1) The series converges for 1 value of $x$. That is, when $x=$ $\qquad$
2) The series converges for $\qquad$ values of $x$.
3) The series converges for values of x . That is, there exists a number R such that the series converges for $|x-a|<$ $\qquad$ and diverges for $|x-a|>$ $\qquad$
Definition: We call R, the radius of $\qquad$ .

Note: For case 1) $R=$ $\qquad$ and for case 2) $R=$ $\qquad$

Definition: The $\qquad$ of convergence (or domain) of a power series is the set (usually in interval notation) of all values of x for which the series converges.

If $|x-a|=R$, then we don't know what it does. We will have to $\qquad$ the series at the endpoints of our interval.

So the interval of convergence could have $\qquad$ possibilities

So how do we find this interval of convergence?
Procedure: Find a limit of your series using the Ratio or Root Test. Call this limit, L. L often depends on $x$, except when $L=0$ or $L=\infty$.
If $L=0$, then $R=$ $\qquad$ and the interval of convergence is $\qquad$ If $L=\infty$, then $R=$ $\qquad$ and the interval of convergence is $\qquad$
If $0<L<\infty$, then solve $L<$ $\qquad$ :
Example: Suppose $L=\frac{1}{5}|2 x-1|$
To find the Radius of Convergence:
To find the Interval of Convergence:

Example 22.1. Find the interval of convergence for $\sum_{n=1}^{\infty} \sqrt{n}(x-2)^{n}$

Example 22.2. Find the interval of convergence for $\sum_{n=1}^{\infty} n^{2 n}(x+1)^{n}$

Example 22.3. Find the interval of convergence for $\sum_{n=1}^{\infty} \frac{(3 x-2)^{n}}{n 3^{n}}$

Example 22.4. Find the interval of convergence for $\sum_{n=0}^{\infty}(-1)^{n} \frac{x^{2 n+1}}{(2 n+1)!}$

### 22.1 Differentiating and Integrating Power Series

Given a power series $\sum_{n=0}^{\infty} c_{n}(x-a)^{n}$ with a radius of convergence R , we can consider the sum of the series as a function of $\qquad$ and we can integrate and differentiate this function on the interval $(a-R, a+R)$. We can then represent $f^{\prime}(x)$ and $\int f(x) d x$ as a power series too.

Theorem Differentiating/Integrating Power Series:
Suppose $\sum c_{n}(x-a)^{n}$ has a radius of convergence R. Then $f(x)=\sum_{n=0}^{\infty} c_{n}(x-a)^{n}=$ is continuous and differentiable on $(a-R, a+R)$ and

1) $f^{\prime}(x)=$
2) $\int f(x) d x=$

Both of these two new power series have the $\qquad$ radius of convergence as $f(x)$.
Note: But the interval of convergence may be $\qquad$

### 22.2 ICE - Power Series

1. Find the radius of convergence and the interval of convergence for the following series. 3 sides!
a) $\sum_{n=1}^{\infty} \frac{x^{n+1}}{(n+1)!}$.
b) $\sum_{n=1}^{\infty} \frac{x^{n}}{n 3^{n}}$.
c) $\sum_{n=1}^{\infty} n^{3}(x-5)^{n}$.
d) $\sum_{n=1}^{\infty} \frac{x^{n}}{\ln (n)^{n}}$.
e) $\sum_{n=1}^{\infty}(n+1)!(x-3)^{n}$.
f) $\sum_{n=1}^{\infty} \frac{n}{b^{n}}(x-a)^{n}$ for $b>0$.

### 22.3 Using Power Series to Represent Functions

If $|r|<1$, the geometric series $\sum_{n=0}^{\infty} a(r)^{n}$ has a sum of $\qquad$
The power series $\sum_{n=0}^{\infty}(x)^{n}$ has a sum of $\qquad$ as long as $|x|<$ $\qquad$
So this means we can represent our function using a series: $f(x)=\frac{1}{1-x}=$
In fact we can do this for a lot of functions. It just requires some creativity!

Example 22.5. Find a power series to represent $f(x)=\frac{1}{1+3 x}$.

Example 22.6. Find a power series to represent $f(x)=\frac{x^{5}}{1+3 x}$.

Example 22.7. Find a power series to represent $f(x)=\frac{1}{x^{3}+x^{2}}$.

Example 22.8. Use your answer from Example 1 to find a power series to represent $g(x)=$ $\frac{\ln (3 x+1)}{3}$.

Example 22.9. Find a power series to represent $f(x)=\frac{1}{(1+x)^{2}}$ What is the radius of convergence?

### 22.4 ICE -Introduction to Taylor Series

1. Given the function $f(x)=\sum_{n=0}^{\infty} c_{n}(x-a)^{n}$. Find the values of the coefficents $c_{0}, c_{1}, c_{2}, \ldots$
a) Find $c_{0}$ by plugging in $x=a$ into $f(x)$.
b) Find $c_{1}$ by plugging in $x=a$ into $f^{\prime}(x)$
c) Find $c_{2}$ by plugging in $x=a$ into $f^{\prime \prime}(x)$.
d) Find $c_{3}$ by plugging in $x=a$ into $f^{\prime \prime \prime}(x)$.
e)Find $c_{4}$ by plugging in $x=a$ into $f^{(4)}(x)$.
f) Can you see the pattern to find $c_{n}$ ?
2. a) Evaluate $\int \frac{x}{1+x^{3}} d x$ as a power series. What is the radius of convergence?
b) What is the maxiumum error if we use the first 5 terms (so up until $n=4$ ) of a power series to approximate $\int_{0}^{0.2} \frac{x}{1+x^{3}} d x$
3. Find a power series to represent $f(x)=x \arctan \left(x^{2}\right)$ [Hint: We would like to find a function $g(x)$ such that $\int g(x) d x=\arctan \left(x^{2}\right)$. So we may want something of the form $\int \frac{d w}{1+w^{2}}$ where $\left.w=x^{2}.\right\} \quad$ What is the radius of convergence?

## 23 Taylor Series

From our ICE sheet we found that if $f(x)=\sum_{n=0}^{\infty} c_{n}(x-a)^{n}$ and $|x-a|<R$, then the coefficients are given by $c_{n}=$ $\qquad$ -

So we can write $f(x)=$
Definition: Taylor Series for $f$ at $a$ :

Definition: Maclaurin Series for $f$ :
(AKA: The Taylor Series for $f$ at 0 )
Definition: The $m^{t h}$-degree Taylor Polynomial for $f$ at $a$ : $T_{m}=$

Example 23.1. Find the 5th degree Taylor polynomial, $T_{5}$ for $f(x)=\cos x$ centered at 0 . Then find the Maclaurin Series for $f(x)=\cos x$. What is the interval of convergence?

Example 23.2. Find the Taylor series for $f(x)=\cos x$ centered at $\frac{\pi}{6}$ after first finding $T_{3}$.

### 23.1 The Binomial Series

We can find the Maclaurin series for $f(x)=(1+x)^{k}$ where $k$ is any real number. In doing so we must determine $f^{(n)}(0)$ for $\mathrm{n}=0,1,2,3, \ldots$. What results is a series called the $\qquad$ series.

## The Binomial Series

For any real number k , and $|x|<1$, then
$(1+x)^{k}=1+k x+\frac{k(k-1)}{2!} x^{2}+\frac{k(k-1)(k-2)}{3!} x^{3}+\ldots=$

Each coefficient can be written as $\binom{k}{n}=\frac{k!}{n!(k-n)!}$ which are called the binomial coefficients.
Note: We must check the convergence at $x= \pm 1$, and the convergence depends on $k$.

Example 23.3. Find the first 4 terms of the Maclaurin series for the function $f(x)=\sqrt{1+x}$ and use it to approximate $\sqrt{1.17}$.

### 23.2 Using Known Maclaurin Series

Of course you can always derive a Maclaurin Series. But often it is quickier if you can memorize a few common ones. Below is a list of common series that may be useful to memorize.
Maclaurin Series and Radii of Convergence

| Function | Radius | Series | Expanded |
| :--- | :--- | :--- | :--- |
| $\frac{1}{1-x}$ | 1 | $\sum_{n=0}^{\infty} x^{n}=$ | $1+x+x^{2}+x^{3}+\ldots$ |
| $e^{x}$ | $\infty$ | $\sum_{n=0}^{\infty} \frac{x^{n}}{n!}=$ | $1+x+\frac{x^{2}}{2!}+\frac{x^{3}}{3!}+\frac{x^{4}}{4!}+\ldots$ |
| $\sin x$ | $\infty$ | $\sum_{n=0}^{\infty}(-1)^{n} \frac{x^{2 n+1}}{(2 n+1)!}=$ | $x-\frac{x^{3}}{3!}+\frac{x^{5}}{5!}-\frac{x^{7}}{7!}+\ldots$ |
| $\cos x$ | $\infty$ | $\sum_{n=0}^{\infty}(-1)^{n} \frac{x^{2 n}}{(2 n)!}=$ | $1+-\frac{x^{2}}{2!}+\frac{x^{4}}{4!}-\frac{x^{6}}{6!}+\ldots$ |
| $\arctan x$ | 1 | $\sum_{n=1}^{\infty}(-1)^{n} \frac{x^{2 n+1}}{2 n+1}=$ | $x-\frac{x^{3}}{3}+\frac{x^{5}}{5}-\frac{x^{7}}{7}+\ldots$ |
| $\ln (1+x)$ | 1 | $\sum_{n=1}^{\infty}(-1)^{n+1} \frac{x^{n}}{n}=$ | $x-\frac{x^{2}}{2}+\frac{x^{3}}{3}-\frac{x^{4}}{4}+\frac{x^{5}}{5}-\ldots$ |
| $(1+x)^{k}$ | 1 | $\sum_{n=0}^{\infty}\binom{k}{n} x^{n}=$ | $1+k x+\frac{k(k-1) x^{2}}{2!}+\frac{k(k-1)(k-2) x^{3}}{3!}+\ldots$ |

Example 23.4. a) Find the sum of the series $1+\ln 2+\frac{(\ln 2)^{2}}{2!}+\frac{(\ln 2)^{3}}{3!}+\ldots$
b) Find the sum of the series $1-\ln 2+\frac{(\ln 2)^{2}}{2!}-\frac{(\ln 2)^{3}}{3!}+\ldots$

Example 23.5. Find the Maclurin series for $f(x)=\sin (2 x)$ and $g(x)=x \sin (2 x)$.

Example 23.6. Find the first four non-zero terms of the Maclaurin series for $f(x)=(\arctan x) e^{x}$.

### 23.3 Using Taylor Polynomials

Why is it useful to use Taylor Polynomials to approximate functions?
Recall, in Section 10, sometimes we have functions that aren't derivatives of a nice function. These are called non-elementary functions. Some other examples include: examples include the elliptical integral: $\int \sqrt{1-x^{4}} d x, \int \ln (\ln (x)) d x, \int \frac{e^{x}}{x} d x, \int e^{e^{x}} d x, \int \frac{1}{\ln x} d x, \int \frac{\sin x}{x} d x, \int \sin \left(x^{2}\right) d x$, and $\int \sqrt{x} \cos (x) d x$. Some of these functions come up in applications, so not being able to calculate them cane be a problem. Luckily Taylor Polynomials can help!

Example 23.7. Recall the Gaussian function $f(x)=e^{-x^{2}}$ is not the derivative of any elementary function. That is, $\int e^{-x^{2}} d x$ does not exist! Represent this function as a Taylor series.

Obviously, an infinite series is not practical to use for applications, so instead we use Taylor Polynomials and the appropriate choice of coefficients, you can approximate any function (within a certain radius of convergence) by a power series with the appropriate choice of coefficients. Let's visualize that Radius of convergence.
Below is the graph of $f_{0}(x)=\sin (x)$ along with several Taylor polynomials. What do you notice?
(2) $f_{0}(x)=\sin (x)$

### 23.4 Remainder Theorem/Error Analysis for Taylor Series

Naturally if we cut off a Taylor Series at say $\mathrm{n}=100$, we are missing terms and will not get an exact solution. The sum of the missing terms is called the $\qquad$ of the Taylor Series and we denote it as $R_{n}(x)$. Then we can write $f(x)=$ $\qquad$ $+$ $\qquad$
Theorem If $f(x)=$ $\qquad$ $+$ $\qquad$ and $\lim _{n \rightarrow \infty} R_{n}(x)=$ $\qquad$ for $|x-a|<R$. Then $f(x)$ is equal to its $\qquad$ series on the interval $|x-a|<R$..

We can use the following to help show that $\lim _{n \rightarrow \infty} R_{n}(x)=$ $\qquad$
Taylor's Inequality if $\left|f^{(n+1)}(x)\right| \leq M$ for $|x-a|<d$, then $\left|R_{n}(x)\right| \leq$
for $|x-a|<d$
Pf. Omitted. See Text.

Example 23.8. Find the maximum error in approximating $\cos (0.4)$ using the $10^{\text {th }}$ degree Maclaurin Series (The 10th degree Taylor Polynomial at 0).

Example 23.9. Find the constant $M$ when approximating $(0.1)^{6}$ using the $3^{\text {rd }}$ degree Maclaurin Series (The 3rd degree Taylor Polynomial at 0).

Example 23.10. ${ }^{2}$ The resistivity $\rho$ of a conducting wire is the reciprocal of the conductivity and is measured in unites of ohm-meters $(\Omega \cdot m)$. The resistivity of a given metal depends on the temperature according to the equation

$$
\rho(t)=\rho_{20} e^{\alpha(t-20)}
$$

where $t$ is the temperature in ${ }^{\circ} \mathrm{C} . \alpha$, the temperature coefficient, and $\rho_{20}$, the resistivity at $20^{\circ} \mathrm{C}$, are constants depending on the metal being used.
Except at very low temperatures, the resistivity varies almost linearly with temperature and so it is common to approximate the expression for $\rho(t)$ by the its first- or second- degree Taylor polynomial at $t=20$. Find expressions for these linear and quadratic approximations.

[^2]
### 23.5 ICE -Taylor Series

1. Recall $\int \frac{\sin x}{x} d x$ cannot be evaluated. Instead represent this integral as a Taylor Series centered at 0 .
2. Recall $\int \sin \left(x^{2}\right) d x$ cannot be evaluated. Instead represent this integral as a Taylor Polynomial of degree 10 centered at 0 .
3. Go to Desmos Graphing Calculator. Let's explore how the 2 function above look as we add more terms to our Taylor Polynomial Appoximatings.
4. Find the Taylor series for $f(x)=e^{3 x}$ centered at $x=5$.
5. Find the Maclaurin series for $f(x)=e^{x}$ by deriving it (don't use a table). What is the Taylor series for $f(x)=e^{x}$ at $x=-1$ ?
6. Find the Taylor series for $f(x)=\sin x$ centered at $a=\frac{\pi}{2}$.
7. Find the Taylor series for $f(x)=x^{-2}$ centered at $a=1$. You can derive this yourself or find the binomial expansion for $(x+1)^{-2}$ Then substitute $x-1$ in.
8. Find the Taylor series for $f(x)=x e^{x}$ at 1. Hint: $f^{(n)}(x)=(x+n) e^{x}$. Then find the Maclaurin series for $f(x)=x e^{x}$ either by using the definition or known series from your table.
9. Find the first three terms (including 0 terms) of the Maclaurin series for $f(x)=e^{x} \ln (1+x)$. Use your chart of known Maclaurin series from your notes!

## 24 Differential Equations

### 24.1 Brief Introduction to Differential Equations

Suppose I know that $f^{\prime}(x)=2 x$ or $y^{\prime}=2 x$. In other words, we know the derivative of a function is equal to $2 x$. Can you determine what y is? What did you do?

The example above is called a separable differentiable equation. It is called a differential equation because it has an unknown function and its derivative. It is separable because you can solve the equation by separating the variables and integrating.

Some differentiable equations are not as easy to solve by hand, like $y^{\prime \prime}+y^{\prime}=\frac{y}{x}+1$, and if you take Differentiable Equations, you will learn techniques to solve or approximate solutions to these equation.

Differentiable equations are often used in modeling. For example, we can represent the population of foxes as a function of time, say $f(t)$.
What does $f^{\prime}(t)$ represent?
Often $f^{\prime}(t)$ is proportional to the population at time $t, f(t)^{3}$.
That is, $f^{\prime}(t)=$
We could also write this as $y^{\prime}=k y$ or $\frac{d y}{d x}=k y$. In words, this means we are looking for a function whose derivative is a constant multiple of itself. What function(s) satisfy this property?

It turns out that $\frac{d y}{d x}=k y$ is separable and we can solve it.

[^3]
### 24.1.1 Law of Natural Growth/Decay

Our work above gives us this important result.
Law of Natural Growth/Decay: If $y$ is the value of a quantity at time $t$ and if the rate of change of $y$ with respect to $t$ is proportional to the size of $y$ at time $t$, then $\frac{d y}{d t}=$ $k$ is the relative growth/decay rate.
If $k>0$, this change is natural $\qquad$ If $k<0$, this change is natural $\qquad$
Theorem: The only solutions to the differential equation $\frac{d y}{d t}=k y$ or $f^{\prime}(t)=k f(t)$ are exponential functions with the form $y(t)=y(0) e^{k t}$ or $f(t)=P_{0} e^{k t}$ That is, if a population has a constant relative growth (decay) rate, it must grow (decay) exponentially.

Example 24.1. A bacteria culture has a constant relative growth rate. (That is, it has a constant growth rate that is proportional to its size.) After 2 hours, the bacteria count was 600 and after 8 hours the count was 75,000. When will there be 200,000 bacteria?

Example 24.2. Tritium-3 has a half-life of 50000 years. Find its constant relative decay rate.

### 24.1.2 Newton's Law of Cooling

Newton's Law of Cooling states that the rate of cooling of an object is proportional to the temperature difference between the object and its surroundings. That is if $T$ is the temperature of the object and $T_{s}$ is the temperature of its surroundings, then $\frac{d T}{d t}=$
Newton's Law of Cooling: $T(t)-T_{s}=\left(T(0)-T_{s}\right) e^{k t}$ Where $T(t)$ is the temperature of the object at time $t$ and $T(0)$ is the initial temperature.
Alternative form: $T(t)=\left(T(0)-T_{s}\right) e^{k t}+T_{s}$

Example 24.3. A root beer is taken from the fridge and its temperature is $5^{\circ}$ C. After 25 minutes, the root beer is $10^{\circ} C$. The temperature in your house is $20^{\circ} C$. What is the temperature of the root beer after 50 minutes?

### 24.1.3 Continuous Compounded Interest

Compounded interest is the result of leaving money in an investment and earning interest on top of old interest.
If a principal of $P_{0}$ dollars is deposited at an annual rate of interest $r$ compounded $n$ times per year, the account will have $A=P_{0}\left(1+\frac{r}{n}\right)^{n t}$ dollars after $t$ years.

Continuous Compound interest is the result of interest accumulating instantaneously.
If a principal of $P_{0}$ dollars is deposited at an interest rate of $r$ compounded continuously for $t$ years, the account will have $A=P_{0} e^{r t}$.

If this is written as a differential equation, we get: $\frac{d A}{d t}=$ $\qquad$ with initial condition $A(0)=P_{0}$

Example 24.4. If $\$ 500$ is borrowed at $14 \%$ interest. What is owed after 2 years if interest is compounded continuously?

### 24.2 General Differential Equations

From looking at the last few examples, we can see that there are many applications to just one type of differential equations. In fact we have only scratched the surface of some of the applications. Other applications include modeling first-order chemical reaction rates, heat transfer, population dynamics, Dielectric breakdown, Computer processing power (Moore's law), and more!

Remember a differential equation is an equation with an unknown function $y$ and its derivative. Beware, $y$ is not a number and represents a function often in terms of time or other variables $y=f(t)$.

Examples:
A) $\frac{d y}{d x}-2 y=\sin (x)$
B) $y^{\prime}(t)=3 t$
C) $e^{y} \frac{d y}{d x}=7 t$
D) $\frac{d^{2} y}{d x^{2}}+4 y=0$
E) $y^{\prime}=x^{2}-y$
F) $\frac{d P}{d t}=0.1 P\left(1-\frac{P}{200}\right)$

Definition 24.1. The $\qquad$ of a differential equation is the order of the highest-order derivative that appears in the equation.

Example: Equations involving only the first derivative of a function (ie no higher order derivatives) are called $\qquad$ -ordered Differential Equations and have the form: $\qquad$

Definition 24.2. A differential equation is linear if the unknown function (ie $y, f(t), \ldots$ ) and its derivative appear only to the first power and are not composed with other functions.

Example: A First-ordered Linear Differential Equation is an equation which involves only linear terms of the function and its derivative.

The standard form of a $1^{\text {st }}$-order Linear Differential Equation:

Note: $P(x)$ and $Q(x)$ are functions of $x$ that need NOT be linear!
Example 24.5. Go back to the example above and identify which differential equations are first order linear equations.

Definition 24.3. The $\qquad$ solution of a D.E. is the most generic possible solution to the D.E. and contains all possible solutions.

Definition 24.4. The $\qquad$ solution of a D.E. is a specific solution to the D.E and satisfies a given initial value or condition of the equation.

Definition 24.5. A First-ordered Differential Equation, $y^{\prime}(x)=f(x, y)$ is $\qquad$ if $f$ can be expressed as a product of a function of $x$ and $y$.

These are set up to be solved through integration!
Standard Form:

Examples:

Example 24.6. Show that $y=A e^{\frac{x^{3}}{3}}$ is a solution to the differential equation $\frac{d y}{d x}=x^{2} y$.

Example 24.7. a) Find the general solution to $e^{y} \frac{d y}{d t}=2 t$.
b) Find the particular solution which satisfies the the initial condition, $y(2)=0, t>\sqrt{3}$.

### 24.3 Optional Topic: Solving First-Order Linear Differential Equations

Recall a First-Order Linear Differential Equation can be written in the form:

$$
\frac{d y}{d x}+P(x) y=Q(x)
$$

Suppose $P(x)$ and $Q(x)$ are constants, say $P(x)=p$ and $Q(x)=q$ where $p$ and $q$ are constants. Then the first-order linear differential equation becomes

$$
\frac{d y}{d x}+p y=q
$$

We already know how to solve this type! Consider $y^{\prime}(t)-7 y(t)=1$.

Conclusion: The general solution to a first-order linear differential equation of the form $y^{\prime}(t)+$ $p y(t)=q$ where $p$ and $q$ are constant is

Now how do we solve $\frac{d y}{d x}+P(x) y=Q(x)$ when $P(x)$ and $Q(x)$ are not constant? Consider the differential equation. $y^{\prime}+\frac{1}{x} y=2$.

How do we find our integrating factor $I(x)$ in general?

- Recall $\frac{d v(x) y}{d x}=v \frac{d y}{d x}+v P(x) y$, differentiating (using implicit differentiation and the product rule to differentiate $v(x) y$ ), we get:
$\frac{d v}{d x} y+v \frac{d y}{d x}=v \frac{d y}{d x}+v P(x) y$
- So $\frac{d v}{d x} y=v P(x) y$
- Solving the separable differential equation, we get
$\int \frac{d v}{v}=\int P(x) d x$
Thus $\ln |v|=\ln (v)=\int P(x) d x$ (recall $v$ is assumed to be positive)
Thus $v=e^{\int P(x) d x}$
Example 24.8. Which of the following are first order differential equations? Write each first order differential equation in standard form, and and identify $P(x)$ and $Q(x)$.

1. $x y^{\prime}=x^{2} y-1$
2. $x \frac{d y}{d x}-x^{2} y=\frac{-1}{x}$
3. $y y^{\prime}=y^{2} x-2 x$
4. $-y^{\prime}+4 \sin (x) y+x \ln (x)=1$

## 2. To Solve a First Order Linear Differential Equation:

1. Write your differential equation in standard form: $\frac{d y}{d x}+P(x) y=Q(x)$.
2. Find your integrating factor: $I(x)=e^{\int P(x) d x}$
3. Multiply both sides of your differential equation by $I(x)$.
4. Recognize your equation as $(I(x) y)^{\prime}=I(x) Q(x)$.
5. Integrate both sides to solve for $y$, so $y=\frac{1}{I(x)}\left(\int I(x) Q(x) d x+C\right)$.
6. Apply initial conditions to find particular solutions if needed.

Example 24.9. Find the solution to $x \frac{d y}{d x}+y-2 \sqrt{x}=0$ for $x>0$.

### 24.4 ICE -Differential Equations

1. What is the order of $y^{\prime \prime}=10-9 y$ ? 2. True or False: $y^{\prime \prime}(t)=10-9 y(t)$ is linear.
2. Find the general (or particular) solution to the following Differential Equations.
(a) $y^{\prime}=\sqrt{x y}$
(c) $x^{3} \frac{d w}{d x}=\sqrt{w}(2 x-1)$
(b) $\frac{d y}{d x}=2-y, y(1)=2$
(d) $\frac{d y}{d x}=e^{x-y}$ where $y(0)=\ln (2)$
3. Give an example of a non-linear differential equation.
4. Give an example of a separable differential equation.
5. Give an example of a 3rd-order differential equation.
6. Find the general (or particular) solution to the following First order linear Differential Equations.
(a) $x y^{\prime}+3 y=1-\frac{1}{x}$
(b) $2 y^{\prime}-y=e^{\frac{x}{4}}$

### 24.5 Slope Fields

Since general solutions to differential equations are families of functions, sometimes it is helpful to visualize these solutions. As we mentioned before, solving differential equations is often pretty difficult, so sometimes we can "plot" our differential equations so we can visualize and approximate solutions. This graphical way to represent solutions to differential equations are called $\qquad$ fields or directional fields.

Method: For $\frac{d y}{d t}=f(t, y)$ [Remember $y$ is a function so you can also represent this by $\frac{d y(t)}{d t}=$ $f(t, y(t))]$. A solution to this equation has the property that at each point $(t, y)$ of the solution curve the slope of the curve is $F(t, y)$. We visualize this by plotting the slop of the solution at selected points of the $t y$-plane. (sometimes instead of $t$, you could have $x$ )

Example 24.10. Plot the Slope Field for $y^{\prime}(x)=2 x$

Example 24.11. The slope field below represents which of the following differential equations?

a) $y^{\prime}=y t$
b) $y^{\prime}=\frac{y}{t}$
c) $y^{\prime}=-y t$

Example 24.12. Match the following Differential Equations with their Slope Fields.

A

C

Example 24.13. Recall in Example 24.6, we verified that $y=A e^{\frac{x^{3}}{3}}$ is a solution to the differential equation $\frac{d y}{d x}=x^{2} y$. Below is the Slope field for $\frac{d y}{d x}=x^{2} y$. Use it to approximate the rate of change of $y(x)$ at $(1,2)$.

Note: Slope Fields are also the basis for many computer-based methods (Like Euler) for approximating solutions of differential equations.

There are many plotting tools online for plotting slope fields.
Here is one: https://www.desmos.com/calculator/p7vd3cdmei

Example 24.14. Kirchoff's Law states that a simple circuit containing a resistor of $R$ ohms and an inductor of $L$ Henrys in series with a source of electromotive force that supplies a voltage $V(t)$ volts at time $t$ satisfies $V(t)=R I+L \frac{d I}{d t}$.
a) Suppose the resistance is 12 ohms, the inductance is 4 Henrys, and a batery gives a constant voltage of 60 V . Write $\frac{d I}{d t}$ in terms of these values.
b) Below is the slope field for this D.E. What can you say about the limiting value of the current?
(c)Identify any equilibrium solutions using the slope field below.
(d) Note if the switch is closed initially, the current starts with $I(0)=0$. Use the direction field to sketch the solution curve.

e) Find the solution to this differential equation with these values (you could also do this in general!).

### 24.5.1 ICE -Slope Fields

1. Match the following Differential Equations with their Slope Fields.

A
2) $y^{\prime}=x e^{y}$

B

C
2. The arrows in the slope field below have slopes that match the derivative $y^{\prime}$ for a range of values of the function $y$ and the independent variable $t$. Suppose that $y(0)=0$. What would you predict for $y(5)$ ?

3. Below is the slope field for $\frac{d y}{d x}=y(1-y)$. As $x \rightarrow \infty$, the solution to the differential equation that satisfies the initial condition $y(0)=2$ will...

(a) Increase asymptotically to $y=1$
(b) Decrease asymptotically to $y=1$
(c) Increase without bound
(d) Decrease without bound
(e) Start and remain horizontal
4. The slope field below indicates that the differential equation has which form?

(a) $y^{\prime}=f(y)$
(b) $y^{\prime}=f(t)$
(c) $y^{\prime}=f(y, t)$
(d) None of the above.
5. Suppose $\frac{d x}{d t}=0.5 x$ and $x(0)=8$. Then the value of $x(2)$ is approximately...
(a) 4
(b) 8
(c) 9
(d) 12
(e) 16

## A Practice Problems and Review for Exams

The following pages are practice problems and main concepts you should master on each exam. Core concepts will have heavier weight than regular concepts.

These problems are meant to help you practice for the exam and are often harder than what you will see on the exam. You should also look over all ICE sheets, Homework problems, Quizzes, and Lecture Notes. Make sure you can do all of the problems in these sets.

Disclaimer: The following lists are topics that you should be familiar with, and these are problems that you should be able to solve. This list may not be complete. You are responsible for everything that we have covered thus far in this course.

I will post the solutions to these practice exams on our blackboard site. If you find any mistakes with my solutions, please let me know right away and feel free to email at any hour.

Good Luck,
Dr. H

## A. 1 Practice Problems for Exam 1

First look over all ICE sheets, Homework problems, Quizzes, and Lecture Notes. Make sure you can do all of those problems. You can also practice with the problems below. Disclaimer: The following is a list of topics that you should be familiar with, and a list of problems that you should be able to solve. This list may not be complete. You are responsible for everything that we have covered thus far in this course.

## Here are the 7 Mastery Concepts:

Concept 1: Differentiation and Integration Techniques

- Know how to use the chain rule, product rule, and quotient rule.
- Know how to use the recognition of antiderivatives and substitution.
- Be able to differentiate and integrate exponential functions, logarithmic functions, inverse trigonometric functions, hyperbolic functions.

Concept 2: Average Value, Net Change, and Mean Value Theorem

- Interpret indefinite integrals as net change, calculate the average value of a function over an interval, and use the Mean Value Theorem for Integrals

Concept 3: Advanced Integration Techniques: Integration by Parts and Partial Fractions

- Recognize and know how to integrate using Integration by Parts

Concept 4: Advanced Integration Techniques: Higher Trigonometric Techniques

- Recognize and know how to integrate using Higher Trigonometric Techniques

Concept 5: Advanced Integration Techniques: Inverse Trigonometric Substitution

- Recognize and know how to integrate using Inverse Trigonometric Substitution

Concept 6: Advanced Integration Techniques: Partial Fractions

- Recognize and know how to integrate using Partial Fractions

Concept 7: Identifying Advanced Integration Techniques:

- You will be given integrals in which you should identify which technique is best to use when integrating and describe your first step for solving the problem.
- Recognize when to integrate using Substitution, Recognition of a derivative of a known function, Integration by Parts, Higher Trigonometric Techniques, Inverse Trigonometric Substitution, and Partial Fractions

Derivatives: Know how to differentiate the following functions:

1. $e^{x}$
2. $\ln x$
3. $\ln |x|$
4. $a^{x}$
5. $\log _{a} x$ (can use change of basis rule to derive)
6. $\arcsin x$
7. $\arccos x$
8. $\arctan x$
9. $\operatorname{arccot} x$
10. $\sinh x$
11. $\cosh x$
12. $\tanh x$
13. $\operatorname{csch} x$
14. sech $x$
15. $\operatorname{coth} x$
16. $\sinh ^{-1} x$
17. $\cosh ^{-1} x$
18. $\tanh ^{-1} x$

Antiderivatives: Know how to integrate the following functions:

1. $e^{x}$
2. $\frac{1}{x}$ (remember absolute value!)
3. $\tan x$ (can derive by using $\frac{\sin x}{\cos x}$ and substitution)
4. $a^{x}$
5. $\frac{1}{\sqrt{1-x^{2}}}$
6. $\frac{-1}{\sqrt{1-x^{2}}}$
7. $\frac{1}{1+x^{2}}$
8. $\frac{1}{a^{2}+x^{2}}$ (can derive by factoring out the $a^{2}$ )
9. $\frac{1}{\sqrt{a^{2}-x^{2}}}$ (can derive by factoring out the $a^{2}$ )
10. $\frac{-1}{\sqrt{a^{2}-x^{2}}}$ (can derive by factoring out the $a^{2}$ )
11. $\sinh x$
12. $\cosh x$
13. $\operatorname{sech}^{2} x$
14. $\frac{1}{\sqrt{1+x^{2}}}$
15. $\frac{1}{\sqrt{x^{2}-1}}$
16. $\frac{1}{1-x^{2}}$

Derivatives: Know how to differentiate the following functions:

1. $e^{x}$
2. $\ln x$
3. $\ln |x|$
4. $a^{x}$
5. $\log _{a} x$ (can use change of basis rule to derive)
6. $\arcsin x$
7. $\arccos x$
8. $\arctan x$
9. $\operatorname{arccot} x$
10. $\sinh x$
11. $\cosh x$
12. $\tanh x$
13. $\operatorname{csch} x$
14. sech $x$
15. $\operatorname{coth} x$
16. $\sinh ^{-1} x$
17. $\cosh ^{-1} x$
18. $\tanh ^{-1} x$

Antiderivatives: Know how to integrate the following functions:

1. $e^{x}$
2. $\frac{1}{x}$ (remember absolute value!)
3. $\tan x$ (can derive by using $\frac{\sin x}{\cos x}$ and substitution)
4. $a^{x}$
5. $\frac{1}{\sqrt{1-x^{2}}}$
6. $\frac{-1}{\sqrt{1-x^{2}}}$
7. $\frac{1}{1+x^{2}}$
8. $\frac{1}{a^{2}+x^{2}}$ (can derive by factoring out the $a^{2}$ )
9. $\frac{1}{\sqrt{a^{2}-x^{2}}}$ (can derive by factoring out the $a^{2}$ )
10. $\frac{-1}{\sqrt{a^{2}-x^{2}}}$ (can derive by factoring out the $a^{2}$ )
11. $\sinh x$
12. $\cosh x$
13. $\operatorname{sech}^{2} x$
14. $\frac{1}{\sqrt{1+x^{2}}}$
15. $\frac{1}{\sqrt{x^{2}-1}}$
16. $\frac{1}{1-x^{2}}$
17. Differentiate the following functions.
a) $y=\ln \left[\left(x^{3}+3 x^{2}\right)^{5}\right]$, for $x>0$
b) $h(x)=\ln \left(\frac{1}{x}\right)+\frac{1}{\ln x}$
c) $f(x)=\arcsin \left(x^{2}\right)$
d) $k(x)=\tanh \sqrt{x}$
e) $f(x)=\log _{2} \tan \left(5 x^{3}\right)$
f) $k(x)=\cosh ^{-1}(\sinh x)$
g) $g(x)=\arctan (\arccos \sqrt{x})$
h) $y=x \cdot \pi^{3 x}$
18. Find the equation to the line tangent to $y=(x-1) e^{x}+3 \ln x+2$ at $x=1$.

Assume all domains of integrals are ok for indefinite integrals.
3. Evaluate $\int\left(2^{\tan \theta} \sec ^{2} \theta\right) d \theta$
4. Evaluate $\int \frac{1}{2 x^{2}+9} d x$
5. Evaluate $\int_{0}^{1}\left(x^{2}+1\right) e^{x^{3}+3 x} d x$
6. Evaluate $\int \frac{x-1}{3 x^{2}-6 x+2} d x$
7. Evaluate $\int \cosh x+\frac{1}{\sqrt{1+x^{2}}} d x$
8. Find the partial fraction for $\frac{x}{x^{4}-1}$. You do not need to solve for the coefficients.
9. Find the partial fraction for $\frac{x^{2}+2 x-1}{2 x^{3}+3 x^{2}-2 x}$. You do not need to solve for the coefficients.
10. Evaluate $\int \arcsin x d x$
11. Evaluate $\int \frac{1}{{\sqrt{x^{2}+5}}^{3}} d x$
12. Evaluate $\int \frac{1}{x^{2} \sqrt{4-x^{2}}} d x$
13. Evaluate $\int \frac{10}{(x-1)\left(x^{2}+9\right)} d x$
14. Evaluate $\int \frac{d x}{\sqrt{4+x^{2}}}$
15. Evaluate $\int \tan ^{4} x \sec ^{2} x d x$
16. Evaluate $\int \frac{1}{(x-1)(x+5)^{2}} d x$
17. Evaluate $\int \frac{d x}{\sqrt{x^{2}+2 x+5}}$
18. Evaluate $\int \sec x d x$.
19. Evaluate $\int x \tan x \sec ^{2} x d x$
20. Evaluate $\int \sin ^{4} x d x$
21. Evaluate $\int \frac{d x}{\sqrt{x^{2}-1}}$
22. Evaluate $\int \frac{e^{2 x}}{e^{2 x}+5 e^{x}+6} d x$
23. The population of goats on a deserted and magical island changes at a rate given by $P^{\prime}(t)=$ $30-20 t$ individuals per year. What does the $\int_{2}^{5} P^{\prime}(t) d t$ represent? What about $\int_{2}^{5}\left|P^{\prime}(t)\right| d t$ ?
24. Assume $f$ is a continuous function with $\int_{2}^{6} f(x) d x=12$. Show that $f$ takes the value of 3 once on the interval $[2,6]$.
25. A magical star is launched into the sky with a trajectory given by $p(t)=t(20-t)$. Find the average height of the star during its flight.

## A. 2 Practice Problems for Exam 2

First look over all ICE sheets, Homework problems, Quizzes, and Lecture Notes. Make sure you can do all of those problems. You can also practice with the problems below. Also look over material from previous exams! Disclaimer: The following is a list of topics that you should be familiar with, and a list of problems that you should be able to solve. This list may not be complete. You are responsible for everything that we have covered thus far in this course.

## Here are the 5 new Mastery Concepts:

Concept 8: Numerical Integration

- You will need to know how to use the Trapezoid Rule.
- You will need to know how to use Simpson's Rule.
- You will need to know how to find the error in a trapezoid approximation and a Simpson's approximation, but I will give you the error formulas.

## Concept 9: Volumes

- Be able to set up integrals that represent the volumes made from rotating functions around lines.
- Know how to use the Disk/Washer Method.
- Know how to use the Shell Method.

Concept 10: Arc Length and Surface Area

- Be able to set up integrals that represent the arc length of functions.
- Be able to set up integrals that represent the surface area from 3-dimensional shapes made from rotating functions around lines.
- Understand which radius and arc length formula to use depending on which variable you are integrating with respect to and which axis you are rotating around.

Concept 11: Work

- Know how to set up and sometimes solve integrals that represent the work done depending on the situation
- Be able to set up an integral that calculates the work done in pumping out water from a tank.

Concept 12: Hydrostatic Force

- Be able to set up an integral that calculates hydrostatic force.

1. Set up an integral representing the surface area obtained by rotating $y=\sqrt{1+e^{x}}$ about the $x$-axis for $0 \leq x \leq 1$, integrate with respect to x .
2. Set up an integral representing the surface area obtained by rotating $y=\sqrt{1+e^{x}}$ about the $x$-axis for $0 \leq x \leq 1$, integrate with respect to $y$.
3. Set up an integral representing the surface area obtained by rotating $y=\sqrt{1+e^{x}}$ about the $y$-axis for $0 \leq x \leq 1$, integrate with respect to x .
4. Set up an integral representing the surface area obtained by rotating $y=\sqrt{1+e^{x}}$ about the $y$-axis for $0 \leq x \leq 1$ but integrate with respect to y .
5. A 200 ft cable that weighs $10 \mathrm{lb} / \mathrm{ft}$ is used to lift a 1600 lb crate of chinchillas out of a 100 foot hole. How much work is required to save the chinchillas (lift them out of the hole)?
6. Suppose a tank has a shape of a half a sphere (spherical part on the bottom) with a radius of 4 ft and a 1 foot spout. Suppose it is completely filled with water. Set up the integral used to find the work required to empty the tank by pumping all the water out of the spout. Use the fact that the weight of water is $62.5 \mathrm{lb} / \mathrm{ft}^{3}$.
7. Suppose a tank has a shape of triangular prism with a height of 4 ft and length of 8 ft and a width of 6 ft with a 2 foot spout. Suppose it is filled to a height of 3 ft with water. Set up an integral to represent the work required to empty the tank by pumping all the water out of the spout. Use the fact that the weight of water is $62.5 \mathrm{lb} / \mathrm{ft}^{3}$.
8. Suppose a tank has a shape of rectangular prism with a height of 3 ft and length of 5 ft and a width of 2 ft with a 1 foot spout. Suppose it is completely filled with water. Set up an integral to represent the work required to empty the tank by pumping all the water out of the spout. Use the fact that the weight of water is $62.5 \mathrm{lb} / \mathrm{ft}^{3}$.
9. A right triangular plate with height of 3 ft , a base of 4 ft and hypotenuse of 5 ft is submerged 2 ft below the surface of the water. Express the hydrostatic force against one side of the plate.
10. A semi-circular plate with diameter 8 m is partially submerged in water so that all but the top 2 meters is submerged in the water. Express the hydrostatic force against one side of the plate. The straight part of the semi-circle is out of the water.
11. A square plate with side length of 8 m is partially submerged in water so that all but the top 3 meters is submerged in the water. Express the hydrostatic force against one side of the plate.
12. a) Use $n=4$ in Simpson's Rule and in the Trapezoid Rule to approximate the area under the curve given by $f(x)=x^{3}$ between $x=1$ and $x=3$.
b) Find the maximum error in $T_{4}$ and $S_{4}$
13. a) Find the equation for the volume of the solid formed by rotating the region bounded by $f(x)=(x-1)^{2}$ and $g(x)=2 x-2$ around the $y$-axis using both the shell method and the disk method.
b) Now use both methods to set up the integral for the region rotated around the line $x=-2$.
14. a) Find the equation for the volume of the solid formed by rotating the region bounded by $f(x)=\sqrt{x}$ and $g(x)=x^{2}$ around the $x$-axis using both the shell method and the disk method.
b) Now use both methods to set up the integral for the region rotated around the line $y=2$.

## A. 3 Practice Problems for Exam 3

First look over all ICE sheets, Homework problems, Quizzes, and Lecture Notes. Make sure you can do all of those problems. You can also practice with the problems below. Also look over material from previous exams! Disclaimer: The following is a list of topics that you should be familiar with, and a list of problems that you should be able to solve. This list may not be complete. You are responsible for everything that we have covered thus far in this course.

## Here are the 3 new Mastery Concepts:

Concept 13: Improper Integrals

- Know how to solve improper integrals using a limit.
- Know how to use comparison tests to check if improper integrals diverge or converge.

Concept 14: Theoretical Understanding of Sequence \& Series Properties, Definitions, \& Theorems

1. These will most likely be short answer or true or false. See problems 5-10
2. Look back through your sequence and series notes.
3. Know that a monotonic and bounded sequence converges.
4. Know the definition of monotonic, bounded, convergent, and divergent sequences.
5. Know the relationship between the sequence of partial sums and series.
6. Determine whether or not a geometric series converges or diverges and find the sum if it is convergent.

Concept 15: Series Tests

- Know how and when to use the Test for Divergence
- Know how and when to use the Integral test
- Know how and when to use the Comparison test and Limit Comparison test
- Know how and when to use the Alternating Series test
- Know how and when to use the Ratio test
- Know how and when to use the Root test
- Know how and when to use the Geometric Series test (and find the sum if the series is convergent)

1. Evaluate the improper integral or show that it diverges. $\int_{1}^{\infty} \frac{\ln x}{x^{3}} d x$
2. Determine whether the integral converges or diverges by using the comparison test: $\int_{1}^{\infty} \frac{\cos x}{1+x^{2}} d x$
3. Evaluate the improper integral or show that it diverges. $\int_{0}^{4} \frac{1}{(2-3 x)^{\frac{1}{3}}} d x$
4. Find the sum of the telescoping series: $\sum_{n=1}^{\infty}\left(\frac{3}{n(n+3)}\right.$
5. Find the sum of the geometric series $\sum_{n=1}^{\infty} \frac{5}{4^{n}}$ or state that it diverges.
6. Determine whether $\sum_{n=1}^{\infty} \frac{(n+1)^{2}}{n(n+4)}$ exists. Find the limit if you can. If the limit does not exist, state why.
7. Determine whether $\sum_{n=1}^{\infty}\left(5(1 / 2)^{n}-3(1 / 2)^{n+1}\right)$ exists. Find the limit if you can. If the limit does not exist, state why.
8. Suppose I have a series $\sum_{n=1}^{\infty} a_{n}$ and $\lim _{n \rightarrow \infty} \frac{a_{n+1}}{a_{n}}=1$. What conclusion, if any, can be drawn about the convergence of $\sum_{n=1}^{\infty} a_{n}$ ? Refer to any Tests, Theorems, or Definitions you use.
9. Suppose I have a series $\sum_{n=1}^{\infty} a_{n}$ and $\lim _{n \rightarrow \infty} \frac{a_{n}}{\frac{1}{n}}=\frac{1}{2}$. What conclusion, if any, can be drawn about the convergence of $\sum_{n=1}^{\infty} a_{n}$ ? Refer to any Tests, Theorems, or Definitions you use.
10. Suppose I have a series $\sum_{n=1}^{\infty} a_{n}, \sum_{n=1}^{\infty} b_{n}$ diverges, and $\lim _{n \rightarrow \infty} \frac{a_{n}}{b_{n}}=0$. What conclusion, if any, can be drawn about the convergence of $\sum_{n=1}^{\infty} a_{n}$ ? Refer to any Tests, Theorems, or Definitions you use.
11. Does the series $\sum_{n=1}^{\infty} \sin \left(\frac{n \pi}{4}\right)$ converge? If so, find the sum. If not state why. Refer to any Tests, Theorems, or Definitions you use.
12. Does the series $\sum_{n=2}^{\infty}(-1)^{n} \sqrt{n^{2}-1}$ converge absolutely, conditionally, or diverge? Refer to any Tests, Theorems, or Definitions you use.
13. Consider the series $\sum_{n=1}^{\infty} \frac{3}{n}$
(a) Write the first three terms of the sequence of terms.
(b) Write the first three terms of the sequence of partial sums.
(c) Does the sequence of terms converge? If so what is its limit? If not, explain why it diverges.
(d) Does the series converge? If so what is its limit? If not, explain why it diverges referring to any theorems or tests used.
14. Does the series $\sum_{n=5}^{\infty} \frac{4^{n+1}}{7^{n-1}}$ converge? If so, find its sum. If not, explain why it diverges.
15. Use the limit comparison test to determine whether $\sum_{n=1}^{\infty} \frac{n^{2}-4}{3 n^{4}+10}$ converges or diverges.
16. Determine whether $\sum_{n=1}^{\infty} \frac{(-1)^{n}}{n^{0.1}}$ is conditionally convergent, absolutely convergent, or divergent.
17. Determine whether $\sum_{n=1}^{\infty}(-1)^{n} \frac{\ln n}{n}$ is conditionally convergent, absolutely convergent, or divergent.
18. Determine whether $\sum_{n=1}^{\infty}(-1)^{n} \frac{n^{2}+1}{3^{n}}$ is conditionally convergent, absolutely convergent, or divergent.
19. Determine whether $\sum_{n=1}^{\infty} \frac{(-5)^{2 n}}{n^{2} 9^{n}}$ is conditionally convergent, absolutely convergent, or divergent.
20. Determine whether $\sum_{n=1}^{\infty}(-1)^{n} \frac{n^{n}}{n!}$ is conditionally convergent, absolutely convergent, or divergent.

## A. 4 Practice Problems for Exam 4

First look over all ICE sheets, Homework problems, Quizzes, and Lecture Notes. Make sure you can do all of those problems. You can also practice with the problems below. Also look over material from previous exams! Disclaimer: The following is a list of topics that you should be familiar with, and a list of problems that you should be able to solve. This list may not be complete. You are responsible for everything that we have covered thus far in this course.

## Here are the 3 New Mastery Concepts:

Concept 16: Interval of Convergence for Power Series

- Be able to determine the radius and interval of convergence for power series
- Be able to represent a function as a power series

Concept 17: Taylor Series

- Know how to find the Taylor or Maclurin Series for a function
- I will give you the formula for the Taylor Series.

Concept 18: Differential Equations and Slope Fields

- Be able to solve separable differential equations.
- Be able to identify and create examples of differential equations with different properties (linear, 2nd-order, separable, etc.)
- Be able to sketch a Slope Field of a Differential Equation.
- Use Slope Fields to approximate values of the function and sketch solutions.
- Be able to recognize and construct differential equations with particular properties like (3ordered, linear, separable, non-separable)

1. Find the radius of convergence and the interval of convergence of the power series $\sum_{n=1}^{\infty}(-1)^{n} \frac{x^{n}}{\sqrt{n}}$.
2. Find the radius of convergence and the interval of convergence of the power series $\sum_{n=1}^{\infty} \frac{x^{n}}{(\ln n)^{n}}$.
3. Find the radius of convergence and the interval of convergence of the power series $\sum_{n=1}^{\infty} \frac{(2 n)!(x-1)^{n}}{(n!)^{2}}$.
4. Find the radius of convergence and the interval of convergence of the power series $\sum_{n=0}^{\infty} \frac{n^{n}(x+2)^{n}}{3^{n}}$.
5. Find a power series representation for $f(x)=\frac{x}{1-x^{2}}$ for $-1<x<1$
6. Find a power series to represent $f(x)=\frac{2}{3+x}$.
7. Find the first four terms of the Maclaurin series expansion of the function $f(x)=\sqrt{1+x}$ at 0 for $-1<x<1$. Use the Binomial series or derive it yourself.
8. Find the $T_{4}(x)$ for $f(x)=\sin x$ at $\mathrm{a}=1$.
9. Find the Taylor series expansion of $f(x)=\sinh x$ at $\mathrm{x}=0$. Recall $\sinh 0=0$ and $\cosh 0=1$.
10. The half-life of radium is 1690 years. If 100 grams of radium are present initially, how much will remain after 200 years? Find an exact answer, not just a decimal approximation.
11. Which of the following is the slope field for $\frac{d y}{d x}=x+y$ ?
(A)

(B)
(D)

12. What does the differential equation $\frac{d y}{d x}=2 y$ tell us about the slope of the solution curves at at any point?
(a) The slope is always 2 .
(b) The slope is equal to the $x$-coordinate.
(c) The slope is equal to the $y$-coordinate.
(d) The slope is equal to two times the $x$-coordinate.
(e) The slope is equal to two times the $y$-coordinate.
(f) None of the above.
13. Solve the following differential equations
(a) $y^{\prime}(t)=\frac{3 t^{2}}{y}$
(b) $\frac{d y}{d x}=e^{\frac{y}{2}} \sin (x)$
14. Solve the following differential equations
(a) $x \frac{d y}{d x}=2 x^{2}+4, y(1)=2$
(b) $y^{\prime}(x)=-2 y-4, y(0)=0$
15. The slope field for a differential equation is given below. Sketch the particular solution for the initial condition $y(0)=-5$ and use it to approximate the value of $y(2.5)$ and $y(5)$.

16. Bonus Topic: Find the general and particular solutions to the following differential equations
(a) $y^{\prime}+4 y=e^{-3 x}, y(0)=4$
(b) $x y^{\prime}+4 y=10 x, y(1)=0, x>0$

## B Homework

Please write your solutions on these homework pages and show enough of your work so that I can follow your thought process. This makes it easier for me to grade. Also please staple the homework together before you turn it in. Sometimes I have my stapler, but there is also a stapler in my office and at the Study Tables.

Follow the instructions for each question. If I can't read your work or answer, you will receive little or no credit!

## B. 1 Calculus II HW 1: Due Tues 9/5

Name:
Follow the instructions for each question and show enough of your work so that I can follow your thought process. If I can't read your work or answer, you will receive little or no credit! Please submit this sheet with your answers. There are Two sides!

1. Differentiate the following functions -You do not need to simplify once you have correctly done the differentiation:
(a) $y=\frac{2}{(3 x-1)^{2}}+\sqrt{7 x+2}$
(c) $h(x)=x^{2} \tan (5 x)$
(b) $g(x)=[\sec (\cos x)]^{3}$
(d) $f(x)=\frac{x-1}{2 x-3}$
2. Review: Use completing the square to to solve $x^{2}+8 x=9$
3. Review: If $x=3 \sin \theta$, draw a right triangle that represents this relationship. [Hint: Solve for $\sin \theta$ and two of the sides of your triangle should have lengths, "x," and " 3. ."]
4. Evaluate the following integrals.
(a) $\int\left(\frac{2}{x^{3}}+\sqrt{x}+1\right) d x$
(b) $\int(3 x+1)^{2} d x$
(c) $\int_{0}^{4} \frac{x}{\sqrt{x^{2}+5}} d x$
(d) $\int \sin (x) \sec ^{2}(\cos (x)) d x$
(f) $\int \frac{x}{5+3 x^{2}} d x$

## B. 2 Calculus II HW 2: Due Tues 9/12

Name:
Follow the instructions for each question and show enough of your work so that I can follow your thought process. If I can't read your work or answer, you will receive little or no credit! Please submit this sheet with your answers. There are two sides!

1. Evaluate the following using hyperbolic functions:
a) $\int \frac{3 \cosh x+9 x^{2}+3}{\sinh x+x^{3}+x} d x$
b) $\int \frac{1}{\sqrt{5+3 x^{2}}} d x$
2. Evaluate $\int 2 x e^{\left(x^{2}+e^{x^{2}}\right)} d x$. [Hint: Simplify using $\left[a^{x} \cdot a^{y}=a^{x+y}\right]$ first, then you can use simple substitution.
3. Archer is creating a balloon arch for Eva's birthday. The equation for the balloon arch is given by the function $y=10 \sin x$ for $0 \leq x \leq \pi$. What is the average height of the arch above the ground? What is the maximum height?
4. The linear density in a rod 8 m long is $\frac{12}{\sqrt{x+1}} \mathrm{~kg} / \mathrm{m}$ where $x$ is measured in meters from one end of the rod. Find the average density of the rod.

## B. 3 Calculus II HW 3: Due Tues 9/19

Name:
Follow the instructions for each question and show enough of your work so that I can follow your thought process. If I can't read your work or answer, you will receive little or no credit! Please submit this sheet with your answers. There are four pages which are two-sided!

1. Evaluate $\int_{1}^{2} x^{2} \ln x d x$.
2. The famous Math Kitties, Eva \& Archer are studying for their calculus class. Archer looks at $\int(\sin (x))^{3} d x$ and sees an inside function $\sin x$. He tells Eva, that he remembers that Dr. Harsy says to look for the simple substitution first, so he is going to try the substitution $w=\sin x$. Explain why this substitution will not work to help evaluate the given integral and suggest a better approach to this integral. Then proceed to evaluate $\int(\sin (x))^{3} d x$.
3. Use Inverse Trigonometric Substitution to evaluate $\int \frac{x^{3}}{\sqrt{9+x^{2}}} d x$.
4. Evaluate $\int \frac{x-2}{x^{4}+x^{2}} d x$.
5. Evaluate $\int(\arcsin x) d x$.
6. The famous Math Kitties, Eva and Archer are discussing how to evaluate $\int \frac{1}{4-x^{2}} d x$. Archer wants to use partial fractions to evaluate the integral, but Eva says she recognizes a version of an inverse hyperbolic function. Who is correct? Are they both correct? If so, evaluate this integral using each of their methods.

## B. 4 Calculus II HW 4: Due Tues 10/3

Name:
Follow the instructions for each question and show enough of your work so that I can follow your thought process. If I can't read your work or answer, you will receive little or no credit! Please submit this sheet with your answers. There are two sides!

1. Eva and Archer are wanting to evaluate $\int e^{x} \sin (2 x) d x$. Eva says that we should suspect that this is an example of a cycling integration by parts problem. Explain why she knows this and then evaluate the integral using this technique.
2. Consider the definite integral $\int_{0}^{1} x \tan (x) d x$. (This problem has multiple parts.)
(a) Explain why this integral cannot be evaluated exactly by using either substitution or by integrating by parts.
(b) Using the appropriate subintervals compute $T_{4}$.
(c) Calculate the maximum error for using $T_{4}$ to approximate the integral.
(d) Using the appropriate subintervals compute $S_{8}$.
(e) Which of the approximations of the integral ( $T_{4}$ or $S_{8}$ ) is an over-estimate? Which is an under-estimate? How do you know?
(f) Bonus: Calculate the maximum error for using $S_{8}$ to approximate the integral.
3. The rate at which water flows through Table Rock Dam on the White River in Branson, MO, is measured in cubic feet per second (CFS). As engineers open the floodgates, flow rates are recorded according to the following chart.

| Water Flow Data |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $t$ <br> seconds | 0 | 10 | 20 | 30 | 40 | 50 | 60 |
| $r(t)$ <br> flow in CFS | 2000 | 2100 | 2400 | 3000 | 3900 | 5100 | 6500 |

(a) What definite integral measures the total volume of water to flow through the dam in the 60 second time period provided by the table above?
(b) Approximate the integral stated in the previous question by calculating for the largest possible value of $S_{n}$, based on the given data.
(c) Compute $\frac{1}{60} S_{n}$ and $\frac{2000+2100+2400+3000+3900+5100+6500}{7}$. What quantity do both of these values estimate? Which is a more accurate approximation?

## B. 5 Calculus II HW 5: Due Tues 10/10

Name:
Follow the instructions for each question and show enough of your work so that I can follow your thought process. If I can't read your work or answer, you will receive little or no credit! Please submit this sheet with your answers. There are two sides!

1. For the following questions, find the equation for the volume of the solid formed by the region bounded by $y=x^{2}$ and $y=2 x$ rotated around the following lines. DO NOT EVALUATE THE INTEGRALS!!! Just set them up.
(a) Draw a clear and clean picture of the area enclosed by the two curves. (Make sure you know which function is the top function.)
(b) Use the Disk/washer method to set up the integral of the region rotated around the $x$-axis.
(c) Use the Disk/washer method to set up the integral of the region rotated around the $y$-axis.
(d) Use the Disk/washer method to set up the integral of the region rotated around the $x=-2$.
(e) Use the Disk/washer method to set up the integral of the region rotated around the $y=-1$.
(f) Use the Disk/washer method to set up the integral of the region rotated around the $y=6$.
(g) Use the Disk/washer method to set up the integral of the region rotated around the $x=6$.
(h) Use the Shell method to set up the integral of the region rotated around the $x$-axis.
(i) Use the Shell method to set up the integral of the region rotated around the $y$-axis.
(j) Use the Shell method to set up the integral of the region rotated around the $x=-2$.
(k) Use the Shell method to set up the integral of the region rotated around the $y=-1$.
(1) Use the Shell method to set up the integral of the region rotated around the $x=6$.
(m) Use the Shell method to set up the integral of the region rotated around the $y=6$.
2. The Magnificent Math Kitties finding the volume made by rotating the region bounded by $f(x)=-x^{2}+3 x \& y=0$ about the $y$-axis. Archer doesn't like to use the shell method, and wants to use the disk/washer method for the problem. Eva argues that this will cause him extra work \& that the shell method is easier. Explain why Eva is correct \& set up a definite integral representing the volume of this rotated region using the shell method.

## B. 6 Calculus II HW 6: Due Tues 10/17

Name:
Follow the instructions for each question and show enough of your work so that I can follow your thought process. If I can't read your work or answer, you will receive little or no credit! Please submit this sheet with your answers.

1. Suppose a tank has a shape of triangular prism with a height of 5 ft and length of 8 ft and a width of 4 ft with a 1 foot spout. Suppose it is filled with water up to a height of 3 ft . Set up an integral to represent the work required to empty the tank by pumping all the water out of the spout. Use the fact that the weight of water is $62.5 \mathrm{lb} / \mathrm{ft}^{3}$.

2. Set up an integral that expresses the hydrostatic force against one side of the vertical plate that is submerged in water with the shape indicated by the picture below. The density of water is $62.5 \mathrm{lb} / \mathrm{ft}^{2}$.

3. Set up an integral that expresses the hydrostatic force against one side of the vertical plate that is submerged in water with the shape indicated by the picture below. The density of water is $62.5 \mathrm{lb} / \mathrm{ft}^{2}$.

4. Set up an integral that expresses the hydrostatic force against one side of the vertical plate that is submerged in water with the shape indicated by the picture below. The density of water is $62.5 \mathrm{lb} / \mathrm{ft}^{2}$.

5. Set up an integral that expresses the hydrostatic force against one side of the vertical plate that is submerged in water with the shape indicated by the picture below. The density of water is $62.5 \mathrm{lb} / \mathrm{ft}^{2}$.

6. Set up an integral that represents the area of the surface obtained by rotating the curve $y=$ $e^{2 x}$ for $0 \leq x \leq 1$ about the following lines.DO NOT EVALUATE THE INTEGRAL.
(a) about the x -axis with respect to $x$
(b) about the x -axis with respect to $y$
(c) about the $y$-axis with respect to $x$
(d) about the $y$-axis with respect to $y$
7. Evaluate $\int_{0}^{1} \frac{1}{x^{\frac{3}{2}}} d x$ or determine if it diverges.

## B. 7 Calculus II HW 7: Due Fri 10/27

Name:
Follow the instructions for each question and show enough of your work so that I can follow your thought process. If I can't read your work or answer, you will receive little or no credit! Please submit this sheet with your answers.

1. Use a Comparison Theorem or The Limit Comparison Theorem to determine whether $\int_{2}^{\infty} \frac{1}{1+8 x+x^{3}} d x$ converges/diverges.
2. Use a Comparison Theorem or The Limit Comparison Theorem to determine whether $\int_{2}^{\infty} \frac{x^{2}+x+2}{1+8 x+x^{3}} d x$ converges/diverges.
3. Determine whether the following sequences are convergent. You must show some form of work or explanation.
a) $a_{n}=<\ln \left(\frac{1+n}{n}\right)>_{n=1}^{\infty}$
b) $a_{1}=2$ and $a_{n+1}=\frac{1}{3-a_{n}}$ [Hint: Show $a_{n}$ is bounded and decreasing and use a theorem.]
c) $c_{n}=\left\{e^{-n} n^{5}\right\}_{n=0}^{\infty}$
d) $d_{n}=\left\{1+\frac{(-1)^{n}}{n}\right\}_{n=0}^{\infty}$
4. ${ }^{4}$ Sequences have many applications in mathematics and the sciences. In a recent paper ${ }^{5}$, the authors write

The incretin hormone glucagon-like peptide-1 (GLP-1) is capable of ameliorating glucose-dependent insulin secretion in subjects with diabetes. However, its very short half-life ( $1.5-5 \mathrm{~min}$ ) in plasma represents a major limitation for its use in the clinical setting.

The half-life of GLP-1 is the time it takes for half of the hormone to decay in its medium. For this exercise, assume the half-life of GLP-1 is 5 minutes. So if $A$ is the amount of GLP-1 in plasma at some time, then only $\frac{A}{2}$ of the hormone will be present after $t+5$ minutes. Suppose we start with $A_{0}=200$ grams of the hormone are initially present in plasma.
(a) Let $A_{1}$ be the amount of GLP-1 present after 5 minutes. Find the value of $A_{1}$.
(b) Let $A_{2}$ be the amount of GLP-1 present after 10 minutes. Find the value of $A_{2}$.
(c) Let $A_{3}$ be the amount of GLP-1 present after 15 minutes. Find the value of $A_{3}$.
(d) Let $A_{n}$ be the amount of GLP-1 present after $5 n$ minutes. Find the value of a formula for $A_{n}$.
(e) Does the sequence $\left\{A_{n}\right\}$ converge or diverge? If the sequence converges, find its limit and explain why this value makes sense in the context of this problem.
(f) Determine the number of minutes it takes until the amount of GLP-1 in plasma is 1 gram.

[^4]
## B. 8 Calculus II HW 8: Due Tues 10/31

Name:
Follow the instructions for each question and show enough of your work so that I can follow your thought process. If I can't read your work or answer, you will receive little or no credit! Please submit this sheet with your answers.

1. For the following series, find the sum of the series or determine that it diverges by writing the series as a geometric series.
a) $\sum_{n=0}^{\infty} \frac{(-2)^{n+1}}{3^{n}}$
b) $\sum_{n=0}^{\infty} \frac{\pi^{n}}{3^{n}}$
c) $\sum_{n=0}^{\infty} \frac{2^{n}}{3^{n-1}}$
d) $\sum_{n=0}^{\infty} \frac{2^{n}}{3^{n+1}}$
2. Find the sum of $\sum_{n=1}^{\infty} \frac{2}{n^{2}+2 n}$ or show that it diverges. Use the fact that $\frac{2}{n^{2}+2 n}=\frac{1}{n}-\frac{1}{n+2}$.
3. The incredible Math Kitties, Eva and Archer are trying to determine the convergence of $\sum_{n=3}^{\infty} \frac{n^{2}-n}{3 n^{2}+n-1}$. Archer says that since the sequence $\left\{\frac{n^{2}-n}{3 n^{2}+n-1}\right\}$ converges, so must the series. Is Archer correct? If not, help Eva correct his logic.
4. The Fabulous Math Kitties, Eva and Archer have found that the $\mathrm{n}^{\text {th }}$ partial sum for the series $\sum_{n=1}^{\infty} a_{n}$ is $s_{n}=\frac{n-1}{n+2}$. Archer says that since the limit of the sequence of partial sums is 1 and not 0 , the series diverges. Eva says that the limit of the sequence of partial sums gives us the value that our series approaches, and thus the sum of our series is 1 . Which Kitty is correct? Explain why and include what mistakes the kitty with the misconception has.

## B. 9 Calculus II HW 9: Due Tues 11/7

Name:
Follow the instructions for each question and show enough of your work so that I can follow your thought process. If I can't read your work or answer, you will receive little or no credit! Please submit this sheet with your answers.

1. We can write $x=0.999999999 \ldots$ as the sum of the geometric series $x=\sum_{n=1}^{\infty} \frac{9}{10^{n}}$. Show that $0.9999999 \ldots=1$. Explain your answer.
2. The Esteemed Math Kitties Eva and Archer are determining the convergence of $\sum_{n=0}^{\infty} \frac{n}{n+1}$. Archer wants to use the Ratio test. Eva says that the Ratio Test will not work in this case. Who is correct? What test should be conducted?
3. The Studious Math Kitties Eva and Archer are trying to determine the convergence for $\sum(-1)^{n} a_{n}$. Archer has found that this series converges by the Alternating Series Test, and says that this must mean $\sum a_{n}$ also converges. Is he correct?
4. For the following series use appropriate tests to determine the convergence or diverges of the following series.
(a) $\sum_{n=2}^{\infty} \frac{n^{3}-1}{n^{7}+1}$
(b) $\sum_{n=0}^{\infty} \frac{(-1)^{n+1}}{\sqrt{n+2}}$
(c) $\sum_{n=1}^{\infty} \frac{100^{n}}{n!}$
(d) $\sum_{n=1}^{\infty}\left(\frac{1}{n^{n}}\right)$
(e) $\sum_{n=3}^{\infty} \frac{1}{n \ln (n)}$

## B. 10 Calculus II HW 10: Due Tues 11/21 Name:

Follow the instructions for each question and show enough of your work so that I can follow your thought process. If I can't read your work or answer, you will receive little or no credit! Please submit this sheet with your answers.

1. Find the radius of convergence and the interval of convergence for $\sum_{n=1}^{\infty} \frac{(x)^{n}}{n^{n}}$.
2. Find the radius of convergence and the interval of convergence for $\sum_{n=1}^{\infty} n!(x+3)^{n+1}$.
3. Find the radius of convergence and the interval of convergence for $\sum_{n=1}^{\infty} 2^{n}(x-2)^{n}$.

## B. 11 Calculus II HW 11: Due Tues 11/28 Name:

Follow the instructions for each question and show enough of your work so that I can follow your thought process. If I can't read your work or answer, you will receive little or no credit! Please submit this sheet with your answers. There are two sides!

1. a) Find $T_{5}(x)$ (the fifth degree Taylor polynomial) for $f(x)=\cos x$ centered at $\frac{\pi}{2}$.
b) Now find a summand formula for the whole Taylor series.
2. Find the third degree Taylor polynomial $T_{3}(x)$ for $f(x)=e^{x} \ln (1+x)$ centered at 0 . Use your list of Maclurin series from your notes.
3. Find a power series to represent $f(x)=\operatorname{arctanh} x$. Use the fact that $\operatorname{arctanh} x=\int \frac{1}{1-x^{2}} d x$. Hint: Don't use a Taylor series. Bonus question if we skipped Functions as Series Notes.

## B. 12 Calculus II HW 12: Due Tues 12/5 Name:

Follow the instructions for each question and show enough of your work so that I can follow your thought process. If I can't read your work or answer, you will receive little or no credit! Please submit this sheet with your answers. There are two sides!

1. Find the general solution to the following differential equations
a) $\frac{d y}{d x}=3 x^{2} y-4 y$
b) $y^{\prime}=\frac{7 e^{2 x}}{y^{2}}$
2. Consider the slope field below. Which of the following forms is this differential equation: $\frac{d y}{d t}=f(y), \frac{d y}{d x}=f(t)$, or $\frac{d y}{d t}=f(y, t)$. Explain your reasoning.

3. The arrows in the slope field below have slopes that match the derivative $y^{\prime}$ for a range of values of the function $y=f(t)$. Suppose that $y(0)=-4$. Draw the particular solution to the differential equation with this initial value condition. What would you predict for $y(5)$ ? Explain your reasoning.

4. The incredible math kitties Eva and Archer are looking at the slope field above. Archer says that from the graph he can see that if he follows the solution with the given value $y(0)=1$, he can see that at $t=1$, the value of $y^{\prime} \approx 0$. Is this the correct way to interpret $y^{\prime}$ from this graph? If not, what is the correct way to interpret $y^{\prime}$ and $y$ when $t=1$ with the initial value $y(0)=1$ ?
5. Bonus First Order Linear problems: Find the general solution to the following differential equations
a) $e^{-x} y^{\prime}+e^{-x} y=4$
b) $\frac{d y}{d x}+3 x^{2} y=x^{2}, y(0)=-1$

## B. 13 Calculus II HW 13: Due Fri 12/8

Name:
This is your last HW for the year!

1. Please complete the Lewis University evaluation for my Calc II class. In the past it has been posted on Bb , but last semester students received an email from noreply@tk20.com or caleighaoconnell@lewisu.edu with a link to do the evaluations. Once you have completed the evaluation, you will get an email. To get credit and in order for me to calculate whether $90 \%$ of the class has completed the evaluation, please forward this email to me. Please give thoughtful, constructive feedback which will help me improve the course. For example saying "You suck" or "You are great" doesn't provide much feedback for me. Saying "You suck because..." or "You are great because..." Also, remember for everything you like about the course, there is at least one other person who dislikes it, so please let me know what you would like to be kept the same about the course.

Check one:
$\square$ I completed the evaluation.I have not completed the evaluation.
2. Create a Meme about this course. It can be something about the topic we covered this semester, but it should relate in some way to this course. On the last day of school, we will share all of the memes and vote for the best one. [Note: You can use a meme that already exists if it relates to this course, but it is more fun to create your own.] I will create an assignment in blackboard in which you can upload your Meme or you can print it and attach to this paper. You can find pictures of Eva and Archer if you would like to use them in your meme here: http://bit.ly/EvaArcherPics.
3. Create a "good" Archer answer relating to something from what we learned in class this semester. So this should be an incorrect answer (but not a trivial incorrect answer) that demonstrates a subtle misconception about a concept or topic in this course. Then write what Eva should say in order to help explain what Archer's misconception is and help correct his mistake. You may want to use the backside of this paper.
